Source

IELTS Academic Writing Task 1 — Original Practice Question Bank
(IELTS_Writing_Task1_Question_Bank.pdf)

How each band was written

- **Band 6** — Overview present but basic or placed late; key features covered, some detail mechanical; figures accurate (may approximate); repetitive linking; 4–7 small learner errors that never block meaning. 160–190 words.
- **Band 7** — Clear overview; key features clearly highlighted; logical progression; range of cohesive devices; some less common vocabulary; 1–3 minor slips. 170–205 words.
- **Band 8** — Key features skilfully selected; clear, well-placed overview; figures used selectively for comparison; wide, precise vocabulary and structures; rare slips at most. 175–215 words.

Checks already done

- every question has all three bands; word counts inside the ranges above
- every figure checked against the question data; figures that are not in the data are derived values (differences, totals, multiples) and were re-checked
- the three answers were written separately (not one essay with words swapped)
- British spelling; no headings or lists; no invented statistics, studies or real people

What to look for

- Does each answer feel like its band (not too strong for 6, not too weak for 8)?
- Band 6 / 7 errors are deliberate — they should be realistic learner errors.
- Task 1: are the key features and the overview right for the visual?
- Task 2: does each essay answer every part of the question?
- Mark ☐ Approved or ☐ Needs changes under each question and add notes.

Households with home internet access, 2000-2020

id wb1_line_01

The line graph below shows the percentage of households with internet access at home in four countries between 2000 and 2020.

Band 6

183 words

Overview present but placed at the end · key features covered with some mechanical listing · adequate vocabulary with repetition · several errors in verb form and comparatives that do not block meaning.

The line graph illustrates the proportion of households which had internet at home in Canada, Poland, Brazil and India from 2000 to 2020.

In 2000, Canada had the highest percentage with 42% of households, while the other three countries were much more lower. Poland had 8%, Brazil had 4% and India had only 1%. Then the figure for Canada increased steadily and reached 74% in 2008 and 89% in 2016. At the end of the period it was 94%, which was still the highest.

Poland also increased very quickly. It rose to 48% in 2008 and then 70% in 2012. In 2020 Poland was 90%, so it almost caught up with Canada. Brazil grew more slowly, from 4% to 40% in 2012 and 71% in 2020. India was the lowest country during all the period. It stayed below 15% until 2012, but after that it increased sharply to 30% in 2016 and 52% in 2020.

Overall, internet access went up in all four countries. Canada was always the highest and India was always the lowest, but the difference between countries became smaller.

Band 7

179 words

Clear overview of main trends · key features highlighted with logical progression · range of linking devices · some less common vocabulary · mostly error-free sentences with a minor comparison slip.

The graph compares the share of homes with an internet connection in four countries, namely Canada, Poland, Brazil and India, over a twenty-year period starting in 2000.

Overall, home internet access expanded considerably in every country. Canada remained the leader throughout, whereas India consistently had the lowest rate, although the differences between the four nations narrowed markedly by 2020.

In 2000, 42% of Canadian households were online, which was far more than Poland (8%), Brazil (4%) and India (1%). Canada's figure rose steadily to 74% in 2008, after which the growth slowed, finishing at 94% in 2020. Poland, by contrast, saw the most dramatic increase, climbing to 70% in 2012 and then 90% by the end of the period, only four points behind Canada.

Brazil's growth was more gradual but still substantial, with the proportion reaching 40% in 2012 and 71% in 2020. India lagged far behind for the first decade and remained at just 14% in 2012. However, it experienced a rapid surge after this, and more than half of Indian households (52%) had access by 2020.

Band 8

198 words

Key features skilfully selected · clear, well-placed overview · accurate figures used selectively for comparison · precise vocabulary such as 'trajectory' and 'diminishing rate' · wide range of error-free structures.

The line graph tracks the percentage of households with home internet access in Canada, Poland, Brazil and India between 2000 and 2020.

The most striking feature is the universal upward trend: all four countries recorded substantial growth, and the initially wide disparities between them had narrowed considerably by 2020. Canada had the highest rate of access at every point, while India remained at the bottom throughout.

At the start of the period, Canada was already well ahead, with 42% of households connected, compared with a mere 8% in Poland, 4% in Brazil and just 1% in India. Canadian access then rose steadily but at a diminishing rate, reaching 83% in 2012 and levelling off at 94% by 2020. Poland's trajectory was far steeper: its figure increased more than eightfold to 70% by 2012 and ultimately stood at 90%, almost matching Canada's.

Brazil and India followed a similar path, albeit from a lower base. Brazilian access climbed consistently to 58% in 2016 and 71% in 2020. India, meanwhile, made little progress in the first eight years, reaching only 6% in 2008, but its growth accelerated sharply thereafter, with the figure more than tripling between 2012 and 2020 to 52%.

☐ Approved ☐ Needs changes Notes:

Electricity generation by source, 1990-2025

id wb1_line_02

The graph below shows the amount of electricity generated from three sources in one country between 1990 and 2025.

Band 6

178 words

Overview given only in the final line · main trends covered but mechanically sequenced (Firstly, Secondly, Also) · repetitive vocabulary · agreement and tense errors that do not impede meaning.

The graph shows how much electricity was produced from coal, natural gas and renewables in one country from 1990 until 2025.

Firstly, coal was the biggest source at the beginning. It was 210 terawatt hours in 1990 and it increase to 232 in 2000. After that it decreased a lot, and it was 130 in 2015 and 70 in 2020. In 2025 coal was only 35 terawatt hours, which is the lowest of the three source.

Secondly, natural gas started at only 20 terawatt hours in 1990. It grew quickly and reached a peak of 140 in 2010. Then it went down slowly to 120 in 2020 and 105 in 2025. In 2015 gas was more than coal for the first time.

Also, renewables was very low in the beginning, only 8 terawatt hours. It stayed low until 2005 but then it rise rapidly. In 2020 it was 140 and in 2025 it reached 190, the highest of all.

In conclusion, coal fell a lot and renewables rose a lot, while natural gas went up and then down.

Band 7

187 words

Clear overview identifying the reversal of coal and renewables · logical progression · good range of cohesive devices · some less common vocabulary · mostly accurate grammar with one preposition slip.

The line graph illustrates the quantity of electricity produced from three sources, namely coal, natural gas and renewables, in a particular country over the period 1990 to 2025.

It is clear that the country's energy mix changed dramatically. Coal went from being the dominant source to the least important one, while renewables rose from a negligible level to become the main source by the end of the period. Natural gas rose and then declined moderately.

Coal generated 210 TWh in 1990 and peaked at 232 TWh in 2000. From then on, its output fell continuously, dropping to 130 TWh in 2015 and to just 35 TWh by 2025. Natural gas, on the other hand, expanded rapidly from 20 TWh to a high of 140 TWh in 2010, and it overtook coal in 2015. After that, however, it decreased gradually to 105 TWh.

Renewables provided only 8 TWh in 1990 and grew slowly for the first fifteen years. From 2005 onwards, generation from this source accelerated sharply, surpassing both of the other fuels by 2020, when it reached 140 TWh, and finally climbing at 190 TWh in 2025.

Band 8

188 words

Skilful selection of key features · well-placed overview capturing the shift in energy mix · accurate figures and derived comparisons · wide, precise vocabulary · varied, error-free sentence structures.

The graph compares electricity output from coal, natural gas and renewable sources in one country across a 35-year period from 1990 to 2025.

Overall, the data reveal a fundamental shift in the country's energy supply. Coal, initially by far the largest source, declined steeply after 2000, whereas renewables, which were almost insignificant in 1990, became the leading source by 2020. Natural gas occupied a middle position, rising to a peak before tapering off.

In 1990, coal accounted for 210 TWh, dwarfing the output of natural gas (20 TWh) and renewables (8 TWh). Coal-fired generation edged up to a high of 232 TWh in 2000 but then went into sustained decline, falling to 130 TWh in 2015 and to a mere 35 TWh by 2025, around one sixth of its 1990 level.

Natural gas, meanwhile, expanded seven-fold to 140 TWh in 2010 and briefly overtook coal in 2015, before slipping back to 105 TWh. The most spectacular growth, however, was in renewables. After modest gains to 25 TWh in 2005, output surged, outstripping both gas and coal by 2020 at 140 TWh and reaching 190 TWh in 2025.

☐ Approved ☐ Needs changes ☐ Notes:

International student enrolments, 2005-2023

id wb1_line_03

The line graph below shows the number of international students enrolled at universities in three countries from 2005 to 2023.

**Band 6**

174 words

Relevant overview placed at the end · key features and the 2020 dip covered · repetitive phrasing · adequate linking · errors in agreement, passive use and article omission that do not block meaning.

The line graph shows the number of international students who studied at universities in three countries, Country A, B and C, between 2005 and 2023.

Country A had the most international students in all years. In 2005 there were 180 thousand students and this number increased every year until 2017, when it was 340 thousand. In 2020 it fell to 300 thousand, but then it increased again to 385 thousand in 2023.

Country B had 120 thousand students in 2005. The number was nearly the same until 2011 and then rose slightly to 140 thousand in 2017. After that it was decreased to 110 thousand in 2020 and increased to 150 thousand in 2023.

Country C was the lowest in 2005 with only 30 thousand students. But it grew very fast and in 2014 it had 140 thousand, which was more than Country B. In 2023 it reached 240 thousand.

Overall, all three countries had more international students at the end, and all of them had a fall in 2020. Country C increased the most.

Band 7

194 words

Clear overview of trends and the shared 2020 dip · key features well highlighted · effective paragraph grouping · good lexical range · largely accurate grammar with one minor slip.

The graph provides information about international student enrolments at universities in three countries, labelled A, B and C, from 2005 to 2023.

Overall, the number of overseas students increased in all three countries across the period, although each experienced a noticeable drop in 2020. Country A attracted the largest numbers throughout, while Country C showed by far the fastest growth.

Country A began with 180,000 international students in 2005, and this figure climbed steadily to 340,000 in 2017. Following a fall to 300,000 in 2020, enrolments recovered strongly to reach a peak of 385,000 in 2023, more than double the original number.

Country B, by contrast, saw relatively little change. Its enrolments hovered between 115,000 and 125,000 until 2014, then rose to 140,000 in 2017 before dipping to 110,000 in 2020. By the end of the period the figure was 150,000. Country C started from a very low base of 30,000, but its numbers grew rapidly and it overtook Country B in 2014 with 140,000 students. Despite a slight decline in 2020, it finished on 240,000, eight times its figure in 2005.

Band 8

195 words

Well-selected key features including the crossover and 2020 downturn · clear overview · accurate, selective figures · sophisticated, precise vocabulary · wide range of structures with no noticeable errors.

The line graph charts the number of international students enrolled at universities in three countries (A, B and C) at three-year intervals between 2005 and 2023.

In general, all three countries ended the period with more overseas students than at the start, despite a simultaneous downturn in 2020. Country A was consistently the most popular destination, while Country C registered the most remarkable growth, eventually overtaking Country B by a wide margin.

Enrolments in Country A rose uninterrupted from 180,000 in 2005 to 340,000 in 2017. Although numbers fell back to 300,000 in 2020, they rebounded sharply to 385,000 in 2023, the highest figure on the graph.

Country B's enrolments, in contrast, were remarkably stable, fluctuating narrowly between 115,000 and 140,000 for most of the period. After slipping to a low of 110,000 in 2020, they recovered to 150,000 by 2023. Country C, meanwhile, grew from just 30,000 students in 2005 to 140,000 in 2014, at which point it surpassed Country B. Its upward trajectory was only briefly interrupted in 2020, and by 2023 it had reached 240,000, an eightfold increase over the period.

☐ Approved ☐ Needs changes ☐ Notes:

Average daily passengers by transport mode, 2010-2022

id wb1_line_04

The graph below shows the average number of passengers using three types of public transport per day in a European city between 2010 and 2022.

**Band 6**

177 words

Overview placed at the end and somewhat basic · key features including the 2020 fall covered · repetitive structures · comma splice, article and agreement errors that do not obscure meaning.

The graph shows the average number of people who used bus, metro and tram every day in a European city from 2010 to 2022.

In 2010, the metro was the most popular with 610 thousand passengers per day, and the bus had 520 thousand. The tram was much less popular, it had only 90 thousand passengers. After that the metro increased every year and reached 820 thousand in 2018. On the other hand, the number of bus passenger went down slowly to 430 thousand in 2018. The tram also grew and it was 210 thousand in 2018.

In 2020 all three types of transport had a big fall. The metro dropped to 470 thousand, the bus to 260 thousand and the tram to 130 thousand. In 2022 the numbers went up again. The metro was 790 thousand, the bus was 380 thousand and tram was 225 thousand, which was its highest number.

Overall, the metro was the most used transport and the tram was the least used. Bus decreased but metro and tram increased in the period.

Band 7

191 words

Clear overview covering growth, decline and the 2020 fall · logical paragraphing · good range of linking · appropriate vocabulary such as 'ridership' · mostly error-free with one minor slip.

The line graph compares the average daily number of passengers travelling by bus, metro and tram in a European city between 2010 and 2022.

Overall, the metro carried the most passengers throughout the period, and its use grew considerably, as did that of the tram. Bus usage, however, declined. All three modes saw a sharp fall in 2020, followed by a partial recovery.

In 2010, around 610,000 people used the metro each day, compared with 520,000 bus passengers and just 90,000 tram users. Over the next eight years, metro ridership rose steadily to 820,000, while the tram more than doubled to 210,000. Bus numbers, in contrast, was falling gradually to 430,000 in 2018.

The year 2020 marked a dramatic drop for every mode. The metro fell to 470,000 passengers a day, the bus to 260,000 and the tram to 130,000. By 2022, the figures had largely bounced back: the metro recovered to 790,000, slightly below its earlier peak, and the bus rose to 380,000. The tram, meanwhile, reached 225,000, the highest figure for this mode over the whole period.

Band 8

210 words

Key features skilfully selected, including the uneven recovery · overview clear and well placed · figures accurate and used for comparison · precise, varied vocabulary · wide range of error-free structures.

The graph illustrates how many passengers, on average, used the bus, metro and tram networks each day in a European city over a twelve-year period beginning in 2010.

The metro was consistently the busiest mode of public transport, and both it and the tram became more heavily used over time, whereas bus travel gradually lost popularity. A further notable feature is the abrupt slump in all three services in 2020, from which they had mostly recovered by 2022.

At the outset, the metro carried 610,000 passengers daily, ahead of the bus with 520,000, while the tram lagged far behind at 90,000. Between 2010 and 2018, the metro gained steadily, peaking at 820,000, and tram use rose to 210,000, more than twice its initial level. Bus journeys moved in the opposite direction, easing down to 430,000.

In 2020, passenger numbers plummeted across the board, with the metro falling to 470,000, the bus to 260,000 and the tram to 130,000. The subsequent rebound was strong but uneven: by 2022 the metro had almost returned to its peak at 790,000, and the tram actually hit a new high of 225,000, yet bus usage, at 380,000, remained well below its 2010 figure.

☐ Approved ☐ Needs changes Notes:

Unemployment rate by age group, 2008-2020

id wb1_line_05

The line graph below shows unemployment rates among three age groups in a European country between 2008 and 2020.

Band 6

166 words

Overview present but placed at the end · main trends covered in a list-like way · limited range of linking · several tense and subject-verb agreement errors, though meaning remains clear.

The line graph gives information about unemployment rate for three age groups, 16-24, 25-49 and 50-64, in a European country between 2008 and 2020.

The youngest group had the highest unemployment in all the years. In 2008 it was 12.5% and then it rose quickly to 24.5% in 2012, that was the highest point on the graph. After this it fell to 14.5% in 2016 and 11.0% in 2018. But in 2020 it went up again to 17.5%.

The 25-49 group was much lower. It start at 5.0% in 2008 and went up to 9.0% in 2012. Then it decreased to 4.0% in 2018 and rise a little to 6.0% in 2020. The 50-64 group had 3.5% in 2008, which was the lowest. It increased to 7.5% in 2012 and after that it go down slowly to 4.5% in 2018 and 5.0% in 2020.

Overall, all groups was increasing until 2012 and then decreasing, and the young people always had more unemployment than the other groups.

Band 7

186 words

Clear overview of the shared pattern · key features highlighted, including the crossover of older groups · logical organisation · good range of cohesive devices · accurate grammar with very few slips.

The graph illustrates the percentage of people who were unemployed in three age groups (16-24, 25-49 and 50-64) in one European country over the period from 2008 to 2020.

Overall, young people aged 16 to 24 were by far the most likely to be unemployed at every point. All three groups followed a broadly similar pattern, with unemployment rising until 2012, falling until 2018 and then increasing again in 2020.

Youth unemployment stood at 12.5% in 2008 before almost doubling to a peak of 24.5% in 2012. It then declined steadily to 11.0% in 2018, its lowest level, but jumped back up to 17.5% by 2020.

The rates for the two older groups were much lower and closer together. Among 25 to 49-year-olds, unemployment rose from 5.0% to 9.0% between 2008 and 2012, then fell to 4.0% in 2018, before increasing slightly to 6.0%. The 50-64 group began with the lowest rate of 3.5% and peaked at 7.5% in 2012. Interestingly, this group's rate declined more slowly, so it was actually higher than the 25-49 group in 2016 and 2018, although this situation reversed in 2020.

Band 8

190 words

Skilful selection of key features, including the relative scale and the crossover · clear overview · accurate figures used comparatively · precise vocabulary such as 'cohorts' and 'in tandem' · wide range of error-free structures.

The line graph compares unemployment rates across three age brackets, 16-24, 25-49 and 50-64, in a European country from 2008 to 2020.

What stands out most is that the youngest workers consistently faced the highest unemployment, with a rate at least double that of either older group throughout. In addition, the three lines moved broadly in tandem, climbing to a peak in 2012, easing until 2018 and then rising once more by 2020.

Among 16 to 24-year-olds, the rate nearly doubled from 12.5% in 2008 to 24.5% in 2012, the highest figure on the graph. A sustained recovery then brought it down to 11.0% by 2018, only for it to rebound to 17.5% in 2020, the sharpest late increase of any group.

The two older cohorts showed far more modest fluctuations. Unemployment among 25 to 49-year-olds rose from 5.0% to 9.0% by 2012, fell to a low of 4.0% in 2018 and edged up to 6.0% in 2020. The 50-64 group started lowest, at 3.5%, and peaked at 7.5% in 2012; however, because its rate fell more gradually, it briefly exceeded that of the middle group in 2016 and 2018.

☐ Approved ☐ Needs changes Notes:

World fish production by method, 1980-2020

id wb1_line_06

The graph below shows world fish production from wild capture and from aquaculture (fish farming) between 1980 and 2020.

Band 6

175 words

Relevant overview but placed at the end · key trends covered with some repetitive detail · adequate vocabulary with repetition of 'million tonnes' · double comparative, comma splice and article errors.

The graph shows the world fish production from wild capture and from aquaculture between 1980 and 2020, and it is measured in million tonnes.

In 1980, wild capture was 68 million tonnes and aquaculture was only 5 million tonnes. So wild capture was much more bigger than fish farming at the start. Wild capture increased to 86 million tonnes in 1990 and it reached the highest point of 94 million tonnes in 2000. After that it was quite stable and it changed only a little, between 89 and 92 million tonnes. In 2020 it was 90 million tonnes.

On the other hand aquaculture grew all the time. It was 13 million tonnes in 1990 and 32 million tonnes in 2000. After 2000 it grow faster, it was 58 million tonnes in 2010 and 76 in 2015. In 2020 it reached 88 million tonnes which is almost same as wild capture.

Overall, wild capture was always higher than aquaculture, but aquaculture increased very much and at the end there was only a small difference between them.

Band 7

186 words

Clear overview contrasting plateau and growth · key features well presented · logical progression · good use of derived comparisons · generally accurate language with an occasional awkward phrase.

The line graph illustrates changes in global fish production from two sources, wild capture and aquaculture, over a forty-year period between 1980 and 2020.

Overall, wild capture remained the larger source throughout, but its output levelled off after 2000. By contrast, aquaculture grew continuously and rapidly, so that by 2020 the two methods were producing almost the same amount of fish.

In 1980, 68 million tonnes of fish were caught in the wild, compared with just 5 million tonnes produced by fish farms. Wild capture rose steadily over the following two decades, reaching a peak of 94 million tonnes in 2000. From that point on, it remained fairly stable, fluctuating between 89 and 92 million tonnes, and it stood at 90 million tonnes in 2020.

Aquaculture, on the other hand, showed uninterrupted growth. Production climbed to 32 million tonnes in 2000 and then accelerated considerably, reaching 58 million tonnes in 2010 and 76 million tonnes five years later. By 2020, fish farming produced 88 million tonnes, which means the gap between both methods had narrowed from 63 million tonnes in 1980 to only 2 million tonnes.

Band 8

186 words

Key features skilfully selected and contrasted · clear, well-placed overview · accurate figures supported by apt derived comparisons · wide, precise vocabulary · varied, error-free structures throughout.

The graph depicts the quantity of fish produced worldwide through wild capture and aquaculture, measured in million tonnes, from 1980 to 2020.

Overall, while wild capture accounted for the greater share of production throughout, it plateaued from around 2000 onwards. Aquaculture, by contrast, expanded relentlessly and by 2020 had almost drawn level with the traditional method.

In 1980, the wild catch totalled 68 million tonnes, dwarfing the mere 5 million tonnes supplied by fish farming. Over the next twenty years, wild capture grew steadily, peaking at 94 million tonnes in 2000. Thereafter, it stagnated, hovering within a narrow band of 89 to 92 million tonnes and finishing the period at 90 million tonnes.

Aquaculture followed a markedly different path. Its output rose modestly at first, to 13 million tonnes in 1990, before gathering pace and reaching 32 million tonnes in 2000. Growth accelerated further in the following two decades, with production jumping from 44 to 76 million tonnes between 2005 and 2015. By 2020, fish farms were generating 88 million tonnes, over seventeen times their 1980 level and only marginally below the volume of wild-caught fish.

☐ Approved ☐ Needs changes Notes:

Population aged 65+ (% of total), 1960-2040

id wb1_line_07

The graph below shows the proportion of the population aged 65 and over in four countries between 1960 and 2020, with projections to 2040.

Band 6

170 words

Overview present but basic and late · key features and projections covered · adequate but repetitive vocabulary · errors in comparative adverbs, verb forms and articles that do not reduce clarity.

The graph shows the percentage of people who are 65 years old or more in Japan, Italy, USA and Mexico from 1960 to 2020, and also the projection until 2040.

In 1960 Italy and USA had the highest percentage, 9.3% and 9.2%. Japan had 5.7% and Mexico had only 3.4%. Japan increased very fast after 1980. It was 17.4% in 2000 and 23.0% in 2010, so it was more than Italy. In 2040 it is expected to be 35.3%, which is the highest.

Italy also increased steadily from 9.3% to 23.3% in 2020 and it will reach 32.1% in 2040. USA increase more slow than Italy and Japan. It was 12.4% in 2000 and 16.6% in 2020, and it will be 21.6% in 2040.

Mexico was the lowest in all period. It stayed below 5% until 2000, but then it started to grow and it is predicted to reach 14.2% in 2040.

Overall, the percentage of old people is increasing in all the countries and Japan has the biggest increase.

Band 7 187 words

Clear overview including Japan's change of rank · key features and projections well organised · some less common vocabulary · accurate, varied sentences with a minor slip in parallel structure.

The line graph compares the proportion of people aged 65 and above in Japan, Italy, the USA and Mexico between 1960 and 2020, together with projections for 2030 and 2040.

Overall, the elderly share of the population has risen, and is expected to continue rising, in all four countries. Japan has experienced the most dramatic growth, moving from third place to first, while Mexico has had the youngest population throughout.

In 1960, older people made up 9.3% of the population in Italy and 9.2% in the USA, compared with 5.7% in Japan and 3.4% in Mexico. Japan's figure then grew rapidly, overtaking the USA in the 1990s and Italy by 2010, when it reached 23.0%. It is projected to climb to 35.3% by 2040, around six times the 1960 level.

Italy also saw a steady increase, and its proportion is forecast to reach 32.1% in 2040. The USA, by contrast, grew more slowly, hovering at roughly 12-13% from 1990 to 2010 and expected to reach 21.6%. Mexico's elderly population stayed below 5% until 2000, but it is predicted to grow faster in the future and reach 14.2%.

Band 8 197 words

Skilful selection including Japan's overtaking and the projection note · clear, well-placed overview · accurate figures used comparatively · wide, precise vocabulary · wide range of error-free structures.

The graph presents the percentage of the population aged 65 and over in Japan, Italy, the USA and Mexico from 1960 to 2020, as well as projected figures up to 2040.

Overall, all four populations have been ageing and are projected to continue doing so. The most notable development is Japan's rapid transformation from a relatively young society into the oldest of the four, whereas Mexico has consistently had the smallest proportion of older people.

In 1960, Italy and the USA had similar shares of over-65s, at 9.3% and 9.2% respectively, while the figures for Japan and Mexico were considerably lower, at 5.7% and 3.4%. Italy's proportion increased steadily, reaching 20.3% in 2010. Japan's, however, accelerated sharply from the 1980s onwards, surpassing Italy's by 2010 at 23.0%. The USA experienced slower and more uneven growth, with virtually no change between 1990 and 2000.

According to the projections, which begin in 2020, Japan will retain its lead, with over-65s forecast to make up 35.3% of the population by 2040, followed closely by Italy at 32.1%. The American figure is expected to rise to 21.6%, whereas Mexico, despite a quickening pace of ageing, is projected to reach only 14.2%.

Electricity demand over 24 hours: winter vs summer

id wb1_line_08

The graph below shows electricity demand in a city on a typical day in winter and a typical day in summer.

Band 6

181 words

Overview at the end but identifies the key contrast · main features described chronologically in a mechanical way · adequate vocabulary · adverb, preposition and tense errors that do not impede meaning.

The graph shows the electricity demand in a city during a normal day in winter and a normal day in summer, in gigawatts.

In winter, the demand at midnight was 32 gigawatts and it went down to 28 at 03:00, which is the lowest. Then it increased to 42 at 09:00. Between 09:00 and 15:00 it was nearly the same, about 40. After that, it reached the peak of 47 gigawatts at 18:00 and then it fell to 33 at the end of the day.

In summer, the demand was lower in the night. It was 22 at midnight and 19 at 03:00. From 06:00 it went up quickly and in 15:00 it was 43, the highest point for summer. This was the only time when summer was more than winter. After this, the demand decreased to 39 at 18:00 and 23 at the end.

Overall, winter demand was higher than summer in most of the day. The winter peak was in the evening but the summer peak was in the afternoon.

Band 7

194 words

Clear overview identifying different peak times · logical progression by season · good range of cohesive devices and vocabulary · frequent error-free sentences with only minor imprecision.

The line graph compares the amount of electricity used in a city over a 24-hour period on a typical winter day and a typical summer day.

Overall, demand was higher in winter for most of the day. Both seasons followed a similar pattern, with the lowest use in the early morning, but they peaked at different times: in the early evening in winter and in the mid-afternoon in summer.

On the winter day, demand stood at 32 gigawatts at midnight and dipped to its lowest point of 28 gigawatts at 03:00. It then rose sharply to 42 gigawatts by 09:00 and remained around 40 gigawatts until 15:00. The highest demand of the day, 47 gigawatts, was recorded at 18:00, after which consumption declined to 33 gigawatts by midnight.

The summer day showed lower figures overall, starting at 22 gigawatts and falling to 19 gigawatts at 03:00. However, demand grew steadily from 06:00 onwards, reaching a peak of 43 gigawatts at 15:00. This was the only point at which summer consumption exceeded that of winter. Following this, it fell back gradually and finished the day on 23 gigawatts.

Band 8

197 words

Key features skilfully selected, especially the differing peak times and single crossover · clear overview · accurate figures and comparison · precise vocabulary such as 'trough' and 'bottoming out' · error-free, varied structures.

The graph illustrates fluctuations in a city's electricity demand, measured in gigawatts, across a typical winter day and a typical summer day.

In general, winter demand was higher than summer demand for almost the entire day. While both followed a broadly similar daily cycle, with a trough in the early hours, the timing of their peaks differed: winter consumption was greatest in the early evening, whereas summer consumption peaked in the afternoon.

In winter, demand began at 32 gigawatts at midnight and fell to a low of 28 gigawatts at 03:00. It then climbed steeply during the morning to 42 gigawatts at 09:00 and held relatively steady at around 40 gigawatts until mid-afternoon. A sharp evening surge followed, taking demand to a daily high of 47 gigawatts at 18:00, before it eased back to 33 gigawatts by the end of the day.

Summer demand was consistently lower overnight, bottoming out at 19 gigawatts at 03:00, some nine gigawatts below the winter figure. From 06:00, however, it rose continuously to reach 43 gigawatts at 15:00, briefly overtaking winter demand. It then declined steadily through the evening, returning to 23 gigawatts at midnight.

House price index (2000 = 100), 2000-2020

id wb1_line_09

The line graph below shows changes in average house prices in three cities between 2000 and 2020, using 2000 as the base year (index = 100).

Band 6

180 words

Basic overview placed at the end · key features and the shared fall covered · simple, repetitive vocabulary · errors in plurals, agreement and relative clauses that do not block communication.

The line graph shows the change of average house prices in three city, City X, City Y and City Z, from 2000 to 2020. The prices is shown as an index and 2000 is 100.

City X had the biggest increase. Its index went up to 150 in 2004 and 185 in 2008. Then it dropped to 160 in 2012 but after that it rose again and reached 255 in 2020, that is the highest on the graph.

City Y also increased but not so much. It rose to 140 in 2008 and then fell to 115 in 2012. After 2012 it increased again slowly and it was 150 in 2020.

City Z was different from the other cities. It increased a little to 105 in 2004, but then it decreased to 98 in 2008 and 80 in 2012. In 2016 it was 92 and in 2020 it finally rose to 118.

Overall, the house prices in all three cities went up during the period but City X went up the most, and all cities fell between 2008 and 2012.

Band 7

192 words

Clear overview of overall growth and the shared downturn · key features highlighted · logical paragraphing · accurate derived comparisons · good vocabulary and generally accurate grammar with a minor superlative slip.

The graph shows how average house prices changed in three cities between 2000 and 2020, with the figures expressed as an index where 2000 equals 100.

Overall, house prices were higher in all three cities by the end of the period, although City X experienced much stronger growth than the other two. Another clear feature is that prices in every city fell between 2008 and 2012 before recovering.

City X saw a rapid increase at first, with its index rising to 150 in 2004 and 185 in 2008. After falling back to 160 in 2012, prices resumed their upward trend and reached 255 by 2020, which means they were more than two and a half times their 2000 level.

City Y followed a similar pattern but at a much lower level. Its index went up to 140 in 2008, dropped to 115 in 2012 and then increased steadily to 150. City Z, however, performed the weakest. After a small rise to 105 in 2004, prices fell below the base level, hitting a low of 80 in 2012. They then recovered gradually, finishing at 118 in 2020, only 18% more than in 2000.

Band 8

196 words

Skilful selection of key features and contrasts · clear, well-placed overview · accurate figures and correct percentage derivation · wide, precise vocabulary ('appreciation', 'stagnated') · varied, error-free structures.

The line graph traces movements in average house prices in Cities X, Y and Z over the two decades from 2000, using an index in which the 2000 price level is set at 100.

Overall, prices ended the period higher in all three cities, but the extent of growth varied greatly, with City X far outperforming the others. It is also evident that all three markets suffered a downturn between 2008 and 2012.

City X experienced the most dramatic appreciation. Its index surged to 185 by 2008, and although it slipped to 160 in 2012, the recovery that followed was vigorous, pushing the index to 255 in 2020. In other words, house prices there rose by 155% over the twenty years.

City Y displayed the same general shape on a smaller scale, climbing to 140 in 2008, falling to 115 in 2012 and then recovering to 150. City Z, by contrast, stagnated for much of the period. After edging up to 105 in 2004, its prices dropped below their original level, bottoming out at 80 in 2012, and they did not exceed the base figure again until the final year, when the index stood at 118.

Monthly visitors to a seaside town, 2010 and 2020

id wb1_line_10

The graph below shows the number of visitors to a seaside town each month in 2010 and 2020.

Band 6

176 words

Overview present but placed late · key comparison covered though detail is somewhat listed · adequate vocabulary · errors in agreement, word order and word form that do not block meaning.

The graph shows how many visitors came to a seaside town in each month of 2010 and 2020.

In 2010, the number of visitors was low in the beginning of the year, about 11 to 15 thousand from January to March. Then it increased quickly from April and in July it was 90 thousand. The highest month was August with 96 thousand visitors. After August the number decreased very fast to 50 thousand in September and 24 thousand in October, and it was only 13 and 14 thousand in November and December.

In 2020 the pattern was similar, but the numbers in summer was much lower. The highest was also August but only 65 thousand, and July was 60 thousand. However, in the winter months there were more visitors than in 2010. For example, January had 18 thousand and December had 28 thousand. October also was higher, 35 thousand compare to 24 thousand in 2010.

Overall, summer was the most popular time in both years, but in 2020 the visitors were more spread in the year.

Band 7

202 words

Clear overview of shared seasonality and flatter 2020 pattern · key features and differences highlighted · good cohesion · appropriate vocabulary · mostly accurate grammar with a slight tense inconsistency.

The line graph compares the number of people who visited a seaside town each month in 2010 with the number in 2020.

Overall, the town was most popular in the summer months in both years, with August being the busiest month. However, the seasonal variation was far less extreme in 2020, as the town attracted fewer visitors in summer but more during the rest of the year.

In 2010, visitor numbers were very low at the start of the year, ranging from 11,000 to 15,000 between January and March. They then rose sharply, reaching 90,000 in July and peaking at 96,000 in August. After this, the figure dropped dramatically to 24,000 in October before falling further to 13,000 and 14,000 in the last two months.

The 2020 figures followed the same general trend but in a much flatter form. The peak in August was only 65,000, around 31,000 fewer than in 2010, and the July figure was 60,000. On the other hand, the off-season months were busier: for instance, January attracted 18,000 visitors, and October and December had 35,000 and 28,000 respectively, both clearly higher than a decade ago.

Band 8

206 words

Key features skilfully selected, including the flattening of the seasonal curve · clear overview · accurate, well-chosen comparisons · precise, flexible vocabulary · wide range of structures with no errors.

The graph compares monthly visitor numbers to a seaside town in 2010 and 2020.

In both years, tourism was heavily concentrated in the summer, with August the peak month. The key difference, however, is that the seasonal pattern became much less pronounced over the decade: summer numbers fell substantially, while the quieter months attracted more visitors.

In 2010, the town received between 11,000 and 15,000 visitors a month during the first quarter. Numbers then rose steeply from April, reaching 90,000 in July and a peak of 96,000 in August, roughly nine times the February low. This was followed by an equally steep decline to 24,000 in October and just 13,000 in November.

By 2020, the summer surge had become far more modest. August remained the busiest month, but with only 65,000 visitors, while July saw 60,000, some 30,000 fewer than a decade earlier. Conversely, arrivals outside the peak season were consistently higher. January and February brought in 18,000 and 17,000 visitors respectively, and the figures for October and December, at 35,000 and 28,000, far exceeded their 2010 equivalents. Only in September were the two years broadly similar, at 50,000 and 48,000.

Cars per 1,000 people, 1970-2020

id wb1_line_11

The graph below shows car ownership per 1,000 people in four countries from 1970 to 2020.

Band 6

171 words

Basic overview at the end · key features covered with list-like figures · adequate vocabulary · errors in comparatives, past tense forms and agreement that do not obscure meaning.

The line graph shows the number of cars for each 1,000 people in Germany, South Korea, Turkey and Netherlands between 1970 and 2020.

In 1970 Germany and the Netherlands had much more cars than the other two countries. Germany had 195 cars per 1,000 people and the Netherlands had 180. Both countries increased a lot until 1980, and Germany reached 390 in 1990 and 515 in 2000. The Netherlands was 370 in 1990 and 390 in 2000. In 2020, Germany had 580 cars and the Netherlands had 490.

South Korea and Turkey had almost no cars in 1970, only 2 and 3. South Korea stayed very low until 1980 but then it rised quickly. It was 170 in 2000 and 375 in 2020. Turkey increase more slowly, it had 65 cars in 2000 and 165 in 2020, which was the lowest of all countries.

Overall, car ownership was going up in all countries. Germany had the most cars in all the period and South Korea have the fastest growth.

Band 7

194 words

Clear overview with main groupings · key features and the crossover highlighted · logical progression · good range of cohesive devices · mostly error-free, with an occasional imprecise word choice.

The graph illustrates the number of cars owned per 1,000 people in four countries, Germany, South Korea, Turkey and the Netherlands, over a fifty-year period from 1970.

Overall, car ownership increased considerably in all four countries. Germany and the Netherlands had far higher rates than the other two for the whole period, although South Korea narrowed the gap significantly after 1990, while Turkey remained well behind.

In 1970, there were 195 cars per 1,000 people in Germany and 180 in the Netherlands. Both countries saw rapid growth during the 1970s, reaching 330 and 320 respectively in 1980. From then on, Germany generally pulled ahead, climbing to 515 in 2000 and 580 in 2020, whereas the Dutch figure rose more gradually to 490.

In contrast, cars were very rare in South Korea and Turkey in 1970, with only 2 and 3 cars per 1,000 people. Turkey was slightly ahead in 1980, but South Korea overtook it by 1990 and then grew remarkably fast, reaching 375 by 2020. Turkey's increase was steadier and more modest, and at 165 it still had the lowest level of car ownership at the end of the period.

Band 8

196 words

Key features skilfully selected, including divergence and South Korea's catch-up · clear overview · accurate figures with valid derived comparison · wide, precise vocabulary · wide range of accurate structures.

The graph charts levels of car ownership, expressed as cars per 1,000 people, in Germany, South Korea, Turkey and the Netherlands between 1970 and 2020.

Overall, car ownership rose substantially in every country. Germany and the Netherlands started from a much higher base and remained ahead throughout, but South Korea closed much of the gap in the later decades, while Turkey's growth, though steady, left it with the lowest rate by some distance.

The two European countries initially had similar levels, with 195 and 180 cars per 1,000 people respectively in 1970, and both rose sharply over the following decade. Thereafter their paths diverged somewhat: ownership in Germany jumped to 515 by 2000 and, after a slight dip in 2010, reached 580 in 2020, whereas the Netherlands experienced slower growth, finishing on 490.

In 1970, by contrast, cars were a rarity in South Korea and Turkey, with just 2 and 3 per 1,000 people. Turkey held a slight lead until 1980, but South Korea subsequently surged ahead, with ownership rising more than sevenfold between 1990 and 2020 to 375. Turkey's figure climbed far more gradually, reaching 165 by the end of the period.

Library loans by format, 2012-2024

id wb1_line_12

The graph below shows the number of items borrowed from public libraries in a town in three different formats between 2012 and 2024.

Band 6

169 words

Overview placed at the end · main trends identified with mechanical detail · limited range of vocabulary · agreement, tense and preposition errors that do not impede communication.

The graph shows how many printed books, e-books and audiobooks were borrowed from public libraries in a town from 2012 to 2024.

Printed books were the most borrowed format in all the years. In 2012 there were 480 thousand loans, but this number decreased steadily to 380 thousand in 2018. Then in 2020 it drop suddenly to 250 thousand. After that it went up to 300 thousand in 2022 and was 290 thousand in 2024.

E-books was very low at first with only 15 thousand loans in 2012. However, it increased every year and it was 110 thousand in 2018. In 2020 it jumped to 205 thousand, which was nearly the same with printed books. It fell a little in 2022 and then reach 215 thousand in 2024.

Audiobooks were also increasing. They were 30 thousand in 2012 and 55 thousand in 2018, and then they rose to 160 thousand in 2024.

Overall, printed books decreased while e-books and audiobooks increased, and the difference between them became much smaller.

Band 7

187 words

Clear overview of decline versus growth · key features and the 2020 change highlighted · effective cohesion · good use of derived comparisons · mostly accurate grammar with a minor 'less/fewer' slip.

The line graph gives information about the number of library loans in a town for three different formats, printed books, e-books and audiobooks, between 2012 and 2024.

Overall, printed books remained the most borrowed format throughout, but their popularity declined considerably. Conversely, loans of e-books and audiobooks increased significantly, which meant that the gap between the formats became much narrower by 2024.

In 2012, printed books accounted for 480,000 loans, far more than audiobooks (30,000) and e-books (15,000). Borrowing of printed books then fell gradually to 380,000 in 2018 before dropping sharply to 250,000 in 2020. It recovered somewhat to 300,000 in 2022 but slipped slightly to 290,000 by the end of the period.

E-book loans, on the other hand, grew steadily, overtaking audiobooks by 2014 and reaching 110,000 in 2018. In 2020 they rose dramatically to 205,000, only 45,000 less than printed books, and after a small drop they stood at 215,000 in 2024. Audiobooks showed a slower but consistent rise, with loans increasing more than fivefold to 160,000 over the twelve years.

Band 8

202 words

Key features skilfully selected, especially the 2020 turning point · clear, well-placed overview · accurate figures and derived comparisons · precise vocabulary · wide range of structures, virtually error-free.

The graph compares the number of items borrowed from a town's public libraries in print, e-book and audiobook formats over the period 2012 to 2024.

Overall, printed books, though still the most popular format at the end of the period, saw a marked decline in borrowing, while digital and audio formats grew strongly. The most abrupt change occurred in 2020, when print loans slumped and e-book loans surged.

Printed book loans fell steadily from 480,000 in 2012 to 380,000 in 2018, before plunging to 250,000 in 2020. Although they partially recovered to 300,000 in 2022, they had eased back to 290,000 by 2024, around 40% below their initial level.

E-books, which accounted for a mere 15,000 loans in 2012, overtook audiobooks within two years and increased steadily to 110,000 by 2018. Their number then almost doubled to 205,000 in 2020, bringing them within reach of printed books, and despite a minor dip, reached 215,000 in 2024. Audiobooks followed a slower but more consistent upward path. After remaining at around 30,000 for the first two years, their loans rose uninterruptedly to 160,000 by the final year, over five times the 2012 figure.

Adult smoking rates by sex, 1975-2020

id wb1_line_13

The graph below shows the percentage of adult men and women who smoked cigarettes in one country between 1975 and 2020.

Band 6

171 words

Overview at the end but accurate · key features, including women's early rise, covered · repetitive phrasing · agreement, passive and article errors, and 'percent' used for points, without blocking meaning.

The graph shows the percentage of men and women who smoked cigarettes in one country between 1975 and 2020.

In 1975, 52% of men was smoking, which was much higher than women with 28%. After that the percentage of men decreased every five years. It was 41% in 1985, 30% in 2000 and 22% in 2010. In 2020 it was only 15%.

The percentage of women was different at the beginning. It increased from 28% in 1975 to 31% in 1980 and 33% in 1985, which was the highest. After 1985 it started to decrease, and it was 27% in 2000 and 19% in 2010. At the end, in 2020, 12% of women smoked.

The difference between men and women became smaller and smaller. In 1975 the difference was 24%, but in 2020 it was only 3%.

Overall, smoking was decreased for both men and women during the period, and men smoked more than women in all the years. However, women's smoking went up in first ten years before it fell.

Band 7

181 words

Clear overview of shared decline and narrowing gap · key features well highlighted · logical progression · accurate derived comparisons · good range of structures with one verb form slip.

The line graph illustrates the proportion of adult men and women who were smokers in a particular country over a 45-year period from 1975 to 2020.

Overall, smoking rates fell significantly for both sexes, although the pattern for women was slightly different at first. Men were more likely to smoke than women throughout the period, but the gap between them narrowed considerably.

In 1975, over half of men (52%) smoked, compared with 28% of women. The male rate then declined steadily and continuously, falling to 36% in 1990 and 22% in 2010, before reaching just 15% in 2020.

Female smoking, by contrast, initially increased, rising to a peak of 33% in 1985. At this point the difference between men and women was only 8 percentage points. From then on, the rate for women also started to fall, although more slowly than for men in the 1990s, dropping to 27% in 2000 and 12% by 2020. Consequently, by the end of the period the difference between the two sexes had shrank to only three percentage points, compared to 24 points in 1975.

Band 8

195 words

Key features skilfully selected and explained through the narrowing gap · clear overview · accurate figures and derived comparisons · precise, natural vocabulary · wide range of error-free structures.

The graph tracks the percentage of adult men and women who smoked cigarettes in one country at five-year intervals between 1975 and 2020.

Overall, smoking became much less common among both men and women over the period. Although men smoked at a higher rate throughout, the gender gap narrowed dramatically, largely because the male rate fell continuously while the female rate initially rose.

In 1975, more than half of adult men smoked (52%), almost double the proportion of women (28%). Male smoking then declined without interruption, at a fairly steady pace, so that by 2000 it had fallen to 30%, and by 2020 it stood at just 15%, less than a third of its original level.

The trend among women was less straightforward. Their smoking rate climbed during the first decade, peaking at 33% in 1985, when it was just 8 points below the male figure. It then entered a gradual decline, falling only modestly to 27% by 2000, before dropping more rapidly to 12% in 2020. As a result, the difference between the sexes shrank from 24 percentage points at the start of the period to a mere 3 points at the end.

Global water use by sector, 1900-2000

id wb1_line_14

The graph below shows global water use by three sectors between 1900 and 2000.

Band 6 180 words

Relevant but late overview · key features covered with chronological listing · adequate vocabulary with an inappropriate noun form · comparative, comma splice and tense errors that do not block meaning.

The graph shows how much water was used in the world by agriculture, industry and domestic from 1900 to 2000.

Agriculture used the most water in all the time. In 1900 it used 500 km³ per year and in 1940 it was 900 km³. After 1940 it increased more faster, it reached 1,450 km³ in 1960 and 2,100 km³ in 1980. In 2000 it was 2,800 km³, which is the highest on the graph.

Industry used much less water than agriculture. It was only 40 km³ in 1900 and 120 km³ in 1940. Then it went up quickly to 330 km³ in 1960 and 720 km³ in 1980. But between 1980 and 2000 it only increased a little, to 790 km³.

Domestic use was the lowest. It started at 20 km³ and grow slowly until 1960, when it was 110 km³. After that it increased to 250 km³ in 1980 and 400 km³ in 2000.

Overall, all three sectors used more water in 2000 than in 1900, and agriculture was always the biggest user.

Band 7 185 words

Clear overview of growth and relative sizes · key features, including the industrial slowdown, highlighted · effective cohesion · appropriate vocabulary · generally accurate grammar with one agreement slip.

The graph shows the amount of water used globally by the agricultural, industrial and domestic sectors over the twentieth century.

Overall, water consumption increased in all three sectors, and the growth became much faster after 1940. Agriculture was by far the largest user throughout the period, while domestic use remained the smallest.

In 1900, agriculture consumed 500 km³ of water per year, compared with just 40 km³ for industry and 20 km³ for domestic purposes. Agricultural use rose slowly at first, to 900 km³ in 1940, but then accelerated dramatically, reaching 2,100 km³ in 1980 and 2,800 km³ by 2000. This was more than five times the figure at the beginning of the century.

Industrial water use also grew relatively slowly until 1940, when it stood at 120 km³. It then increased rapidly to 720 km³ in 1980; however, the following twenty years saw only a small further rise, to 790 km³. Domestic consumption followed a steadier upward trend, climbing to 110 km³ in 1960 and then to 400 km³ in 2000, which represent a twentyfold increase over the whole period.

Band 8

192 words

Skilful selection of key features, including the industrial plateau · clear overview · accurate figures with precise derived comparisons · wide, precise vocabulary · varied structures without errors.

The graph illustrates global water consumption, in cubic kilometres per year, by agriculture, industry and households between 1900 and 2000.

Overall, water use rose across all three sectors, with growth becoming markedly steeper from the middle of the century. Agriculture was consistently the dominant consumer, using more water than the other two sectors combined at every point, whereas domestic use remained the smallest.

At the start of the century, agriculture already accounted for 500 km³, compared with 40 km³ for industry and a mere 20 km³ for domestic use. Agricultural consumption grew gradually to 900 km³ by 1940, after which it soared, reaching 1,450 km³ in 1960 and 2,800 km³ in 2000.

Industrial use showed a similar acceleration after 1940, increasing sixfold from 120 km³ to 720 km³ between 1940 and 1980. Unlike the other sectors, however, it then levelled off, edging up to only 790 km³ by the end of the century. Domestic consumption, meanwhile, increased more steadily, although it too gathered pace in the second half of the period, more than doubling between 1960 and 1980 and rising to 400 km³ in 2000, twenty times its 1900 level.

☐ Approved ☐ Needs changes Notes:

New car sales by fuel type, 2014-2024

id wb1_line_15

The graph below shows annual sales of new cars by fuel type in one country between 2014 and 2024.

Band 6

186 words

Overview present but placed late · key trends covered mechanically · repetitive vocabulary · agreement errors and an incorrect linking phrase, but meaning is always clear.

The graph shows the number of new cars which were sold in one country from 2014 to 2024, and it divide them into petrol, diesel, electric and hybrid cars.

In 2014, petrol and diesel cars was the most popular. Petrol had 1,150 thousand sales and diesel had 1,100 thousand. Electric and hybrid cars were very low, only 5 and 30 thousand. After that petrol went up to 1,300 thousand in 2018, but diesel decreased to 700 thousand in the same year.

From 2018 both petrol and diesel fell a lot. In 2020 petrol was 900 thousand and diesel was 280 thousand. In 2024 petrol was 700 thousand and diesel was only 90 thousand, so diesel became the least popular.

In the other hand, electric and hybrid cars increased very fast after 2018. Hybrid cars reached 170 thousand in 2020 and 410 thousand in 2024. Electric cars rose to 270 thousand in 2022 and to 480 thousand in 2024, which was more than hybrid.

Overall, petrol and diesel cars decreased and electric and hybrid cars increased, but petrol was still the highest in 2024.

Band 7

200 words

Clear overview of the shift in fuel types · key features and crossovers highlighted · logical grouping · good range of cohesive devices · mostly error-free, with a minor pronoun agreement slip.

The line graph compares annual sales of new cars in one country according to four types of fuel, petrol, diesel, electric and hybrid, from 2014 to 2024.

Overall, there was a clear shift away from conventional fuels towards electric and hybrid vehicles. Although petrol cars remained the best-selling type in 2024, sales of diesel cars collapsed, while those of electric and hybrid cars increased dramatically.

In 2014, petrol and diesel cars dominated the market, with sales of 1,150,000 and 1,100,000 respectively. Petrol sales continued to grow to a peak of 1,300,000 in 2018, whereas diesel sales had already begun to fall, dropping to 700,000 in that year. After 2018, both declined steeply, and by 2024 only 700,000 petrol cars and 90,000 diesel cars were sold.

By contrast, electric and hybrid cars accounted for tiny numbers in 2014, at 5,000 and 30,000. Their sales rose slowly until 2018 and then took off. Hybrid sales reached 320,000 in 2022 and 410,000 in 2024. Electric cars grew even more quickly, and they overtook hybrids in the final two years to reach 480,000, making it the second most popular type.

Band 8

197 words

Key features skilfully selected, including crossovers and divergence · clear overview · accurate figures and valid derived comparison · precise, varied vocabulary · wide range of error-free structures.

The graph illustrates how sales of new cars in one country were divided between petrol, diesel, electric and hybrid models over the decade from 2014 to 2024.

Overall, the market underwent a significant transformation. Diesel sales collapsed and petrol sales, after an initial rise, also contracted, although petrol remained the best-selling fuel type. Meanwhile, electric and hybrid cars rose from near-insignificance to become major players.

In 2014, petrol and diesel cars were almost equally popular, selling 1,150,000 and 1,100,000 units respectively. Their paths soon diverged, however. Petrol sales climbed to a high of 1,300,000 in 2018 before falling to 700,000 by 2024, whereas diesel sales plummeted from 2016 onwards, reaching just 90,000 in 2024, less than a tenth of their original level.

Electric and hybrid vehicles, by contrast, sold only 5,000 and 30,000 units respectively in 2014, and growth remained modest until 2018. From then on, both expanded rapidly. Hybrids reached 320,000 in 2022, overtaking diesel, and continued rising to 410,000. Electric car sales were even more spectacular, surging to 480,000 in 2024 and thereby overtaking hybrids to become the second most popular category.

☐ Approved ☐ Needs changes Notes:

Birth rate (births per 1,000 people), 1950-2020

id wb1_line_16

The graph below shows birth rates in three countries between 1950 and 2020.

Band 6 180 words

Basic overview at the end · key features, including the final crossover, covered · repetitive linking · tense errors, a comma splice and adverb placement errors that do not block meaning.

The line graph shows the birth rate in three countries, Country P, Country Q and Country R, between 1950 and 2020. It is measured in births per 1,000 people.

Country P had the highest birth rate for all the period. It was 44 in 1950 and it increased a little to 45 in 1960. After that it decreased steadily, it was 35 in 1980, 22 in 2000 and 15 in 2020.

Country R was the second in 1950 with 36 births. It went up to 38 in 1960 but then it fell very quickly to 20 in 1980. After 1980 it continued to decrease more slowly and in 2020 it was only 9, which was lower than Country Q.

Country Q had the lowest birth rate in most years. It started at 22 in 1950 and it went down slowly to 14 in 1980. Then it was quite stable, about 12 or 13, and it was 11 in 2020.

Overall, the birth rates in all three countries decreased between 1950 and 2020, and Country P always was the highest.

Band 7 191 words

Clear overview identifying the steepest fall and final crossover · key features logically organised · good cohesion · appropriate vocabulary · largely accurate grammar with one minor plural slip.

The graph illustrates changes in the birth rate, measured as the number of births per 1,000 people, in three countries labelled P, Q and R from 1950 to 2020.

Overall, birth rates fell in all three countries over the seventy years. Country P had the highest rate throughout, while Country R experienced the most dramatic decline, eventually falling below Country Q to record the lowest rate by 2020.

In 1950, there were 44 births per 1,000 people in Country P and 36 in Country R. Both figures increased slightly over the next decade, to 45 and 38 respectively. From 1960, however, the rates in both countries began to fall. Country R's rate dropped particularly sharply, almost halving to 20 between 1960 and 1980, and then continued to decline more gradually to just 9 in 2020. Country P's decrease was steadier, and its rate reached 15 at the end of the period.

Country Q, by contrast, began with a much lower birth rate of 22 in 1950. This declined gradually to 14 in 1980 and then levelled off at around 12 or 13 for three decades, before finishing at 11.

Band 8

199 words

Key features skilfully selected, including differing rates of decline · clear, well-placed overview · accurate figures and derived fractions · wide, precise vocabulary · varied, error-free structures.

The graph compares birth rates, expressed as births per 1,000 people, in Countries P, Q and R between 1950 and 2020.

The overall trend was one of decline in all three countries, although the pace and timing varied. Country P consistently had the highest birth rate, whereas Country R, having started well above Country Q, underwent such a steep fall that it ended the period with the lowest rate.

Countries P and R initially followed a similar pattern, with their birth rates rising slightly between 1950 and 1960, to 45 and 38 respectively. Thereafter, both declined, but at very different speeds. Country R's rate plunged to 20 by 1980, and it continued to edge downwards, eventually reaching 9 in 2020, a quarter of its 1950 figure. Country P, meanwhile, experienced a more gradual but uninterrupted decrease from 1960, falling to 28 in 1990 and 15 in 2020, one third of its peak.

Country Q, by contrast, had a comparatively low birth rate from the outset, at 22 in 1950. It declined moderately to 14 by 1980 and then remained almost flat, fluctuating between 12 and 13 for three decades before dipping to 11, just above Country R's figure.

International visitor arrivals, 2015-2023

id wb1_line_17

The line graph below shows the number of overseas visitors to three countries between 2015 and 2023.

Band 6

173 words

Overview present but late and simplistic · key features, including the 2020 collapse, covered · adequate but repetitive vocabulary · comma splices, a 'less/fewer' error and a verb form error.

The graph shows the number of international visitors who travelled to Spain, Thailand and Mexico between 2015 and 2023.

Spain had the most visitors in most years. In 2015 there were 68 million visitors and this increased every year to 84 million in 2019. Thailand and Mexico had much less visitors, about 30 million in 2015, and both of them increased slowly to 40 and 45 million in 2019.

In 2020 there was a big fall in all countries. Spain dropped to only 19 million and Thailand to 7 million. Mexico also fell to 24 million but it was the highest country in this year. In 2021 Thailand got almost no visitor, only 0.4 million, while Mexico went back to 32 million.

After 2021 the number of visitors increased again. In 2023 Spain had 85 million, it was more than in 2019. Mexico had 42 million, but Thailand only had 28 million.

Overall, the three countries had similar trends, they increased, then fell in 2020 and after that recovered, but Thailand recover slowly.

Band 7

191 words

Clear overview of growth, collapse and uneven recovery · key features highlighted · logical progression · good range of cohesive devices · accurate derived comparisons · generally accurate with a minor slip.

The line graph compares the number of international tourists arriving in Spain, Thailand and Mexico each year from 2015 to 2023.

Overall, arrivals in all three countries grew steadily until 2019, collapsed in 2020 and then recovered. Spain was the most popular destination in most years, but the extent of the recovery varied considerably, with Thailand recovering the slowest.

Between 2015 and 2019, visitor numbers to Spain rose from 68 million to 84 million, while Mexico and Thailand, which started at similar levels, increased to 45 million and 40 million respectively. In 2020, however, all three experienced a dramatic decline. Spain's arrivals fell to 19 million, less than a quarter of the previous year, and Thailand's dropped to 7 million. Mexico was affected the least, with 24 million visitors, making it the most visited of the three countries that year.

In 2021, Thailand's figure fell even further to just 0.4 million, whereas Mexico had already returned to 32 million. By 2023, Spain had fully recovered, with 85 million arrivals, surpassing its 2019 level. Mexico's figure was 42 million, slightly below than its pre-2020 peak, while Thailand attracted only 28 million visitors.

Band 8

197 words

Skilful selection of key features, including Mexico's brief lead · clear overview · accurate figures and derived comparisons · precise vocabulary such as 'resilient' · wide range of error-free structures.

The graph presents annual international visitor arrivals in Spain, Thailand and Mexico between 2015 and 2023.

The three countries followed a broadly similar trajectory, with steady growth to 2019, a sudden collapse in 2020 and a subsequent recovery. However, the scale of both the downturn and the rebound differed markedly: Spain regained and slightly exceeded its former level, whereas Thailand was still well short of it in 2023.

Spain was consistently the leading destination apart from the disrupted years. Its arrivals climbed from 68 million in 2015 to 84 million in 2019, while Mexico and Thailand, both starting at around 30 million, reached 45 million and 40 million respectively.

The drop in 2020 was severe for Spain and Thailand, whose figures plummeted to 19 million and 7 million. Mexico proved far more resilient, falling only to 24 million and, in 2021, briefly overtaking Spain with 32 million arrivals against 31 million. Thailand, meanwhile, sank further to a negligible 0.4 million that year. The recovery thereafter was rapid for Spain, which reached a peak of 85 million by 2023, and fairly solid for Mexico, at 42 million, but Thailand's 28 million remained around 70% of its 2019 total.

Recycling rates by material, 2000-2020

id wb1_line_18

The graph below shows the recycling rates of four types of material in a city between 2000 and 2020.

Band 6

182 words

Overview present but placed at the end · key features covered, including the aluminium dip · repetitive sentence patterns · agreement, article and verb form errors that do not affect meaning.

The graph shows the percentage of paper, glass, aluminium cans and plastic that was recycled in a city from 2000 to 2020.

Paper had the highest recycling rate in every year. In 2000 it was 45% and it increased to 58% in 2005 and 66% in 2010. After that it grew more slowly and it was 72% in 2020. Glass was the second. It started at 30% and went up steadily to 55% in 2010 and 68% in 2020, so it was nearly same as paper at the end.

The recycling of aluminium cans was 20% in 2000. It increased quickly to 52% in 2010 and 60% in 2015, but then it drop a little to 58% in 2020. This was the only material which decreased.

Plastic had the lowest rate in all the years. In 2000 only 3% of plastic were recycled. It increased slowly to 14% in 2010 and then it rise to 30% in 2020.

Overall, the recycling rates of all materials was higher in 2020 than in 2000, and paper was the highest while plastic was the lowest.

Band 7

187 words

Clear overview · key features and the aluminium decline highlighted · logical grouping · good use of derived comparisons · appropriate vocabulary · mostly accurate grammar with a minor word order slip.

The line graph illustrates how the recycling rates for four materials, paper, glass, aluminium cans and plastic, changed in a city over a twenty-year period from 2000.

Overall, the proportion of each material being recycled increased considerably. Paper was recycled at the highest rate throughout, whereas plastic consistently had the lowest rate, despite showing steady growth.

In 2000, 45% of paper was recycled, and this figure rose quickly to 66% in 2010 before levelling off at 72% in 2020. Glass followed a similar upward trend but from a lower starting point of 30%. Its rate increased steadily, reaching 68% by the end of the period, only four points below paper.

Aluminium cans saw the most rapid improvement in the first decade, with the rate increasing from 20% to 52%. It peaked at 60% in 2015 but then slightly declined to 58% in 2020, making it the only material whose recycling rate fell at any point. Plastic, on the other hand, was recycled at very low levels, with only 3% in 2000. Nevertheless, its rate grew continuously, reaching 30% by 2020, which was ten times its initial figure.

Band 8

194 words

Key features skilfully selected, including relative versus absolute change · clear overview · accurate figures and derived comparisons · precise, varied vocabulary · wide range of error-free structures.

The graph compares the percentage of paper, glass, aluminium cans and plastic recycled in a city at five-year intervals between 2000 and 2020.

Overall, recycling rates improved for all four materials over the two decades. Paper was recycled most extensively throughout, while plastic lagged well behind the others, although it recorded the largest relative increase.

Paper began the period with a recycling rate of 45%, which rose quickly to 66% in 2010 and then more slowly to 72% in 2020. Glass showed a comparable but steeper trajectory, more than doubling from 30% to 68%, so that by the end of the period it had almost caught up with paper.

Aluminium cans registered the sharpest gains in the first decade, with their recycling rate soaring from 20% to 52%. Growth then slowed, and after peaking at 60% in 2015 the rate dipped marginally to 58%, the only decline shown on the graph. Plastic, by contrast, started from a strikingly low base of just 3%. Its rate rose gradually but consistently, reaching 30% in 2020; while this represented a tenfold increase, it was still only around half the rate for aluminium cans, the next lowest material.

☐ Approved ☐ Needs changes Notes:

Average one-way commute time, 2004-2024

id wb1_line_19

The graph below shows the average one-way commuting time in four cities between 2004 and 2024.

Band 6

190 words

Overview placed at the end and loosely linked · key features covered with some list-like detail · limited cohesive range · collocation, agreement and comma splice errors that do not block meaning.

The graph shows the average time that people spent to commute one way in four cities, City A, B, C and D, from 2004 to 2024.

In 2004 City D had the longest commuting time with 45 minutes and City C had the shortest with 22 minutes. City A was 38 minutes and City B was 29 minutes.

City A increased steadily and in 2016 it was 52 minutes, which was the longest on the graph. City C also increased a lot, from 22 to 40 minutes in 2016. However, City D decreased every year and it was 37 minutes in 2016. City B did not change much, it was about 30 minutes.

In 2020, all four cities had a fall. For example City A dropped to 41 minutes and City B dropped to 25 minutes. After that, commuting times was going up again in 2024. City A was 49 minutes, City C was 44 minutes, City D was 33 and City B was 31.

Overall, City A and C got longer commuting time, City D got shorter and City B was stable, also all of them decreased in 2020.

Band 7

203 words

Clear overview of diverging trends and the 2020 dip · key features well highlighted · logical organisation · range of cohesive devices, with slight overuse of 'with' structures · largely error-free.

The line graph provides information about the average time taken to commute one way in four cities between 2004 and 2024.

Overall, commuting times rose noticeably in City A and City C, while City D's fell and City B's remained fairly stable. Another clear feature is that every city experienced a drop in 2020, followed by an increase in 2024.

In 2004, City D had the longest average commute at 45 minutes, followed by City A (38 minutes), City B (29 minutes) and City C (22 minutes). Over the next twelve years, commuting times in City A increased steadily to 52 minutes, and City C's also grew rapidly, reaching 40 minutes in 2016. By contrast, the figure for City D declined gradually to 37 minutes, meaning that it was overtaken by both of them.

City B, however, changed very little during this time, ranging between 29 and 33 minutes. In 2020 all four cities saw shorter commutes, with City B recording the lowest figure of 25 minutes. By 2024, times had risen again, with City A at 49 minutes, City C at 44 minutes, which was double its 2004 figure, and City B and City D at 31 and 33 minutes respectively.

Band 8

208 words

Key features skilfully selected, including crossovers and the 2020 dip · clear, well-placed overview · accurate figures and derived comparisons · precise, flexible vocabulary · wide range of error-free structures.

The graph compares the average length of a one-way commute in Cities A, B, C and D over the twenty years from 2004 to 2024.

Overall, the cities followed different long-term trends: commuting times lengthened considerably in City A and City C, contracted in City D and changed little in City B. All four, however, saw a temporary reduction in 2020, and City A ended the period with the longest commute.

In 2004, commuters in City D faced the longest journeys, at 45 minutes, whereas those in City C had the shortest, at just 22 minutes. Over the following twelve years, City A's average rose steadily from 38 to a peak of 52 minutes, and City C's climbed even more steeply to 40 minutes. City D moved in the opposite direction, falling to 37 minutes, so that by 2016 it had been overtaken by both. City B, meanwhile, remained remarkably consistent at around half an hour.

In 2020, times dropped across the board, most noticeably in City A, where they fell by 11 minutes to 41. The subsequent rebound left City A on 49 minutes and City C on 44, twice its initial figure, while City B returned to 31 minutes and City D edged up to 33.

☐ Approved ☐ Needs changes Notes:

Telephone subscriptions per 100 people, 1995-2025

id wb1_line_20

The graph below shows the number of mobile phone and landline telephone subscriptions per 100 people in one country from 1995 to 2025.

Band 6

167 words

Overview present but placed at the end and repetitive · key features including the crossover covered · limited vocabulary · pronoun agreement, preposition and double comparative errors that do not block meaning.

The graph shows the number of mobile phone subscriptions and landline subscriptions for every 100 people in one country between 1995 and 2025.

In 1995, landline was much more popular than mobile phone. There were 48 landline subscriptions per 100 people but only 6 mobile phone subscriptions. The landline went up a little to 52 in 2000, but after that it started to decrease. It was 42 in 2010 and 24 in 2020, and in 2025 it was only 17.

On the other hand, mobile phone subscriptions increased very fast. It was 38 in 2000 and 82 in 2005, so it became more than landline in this period. In 2010 it was 110, that means there were more mobile phones than people. After 2010 it continued to increase but more slowly, and it reached to 131 in 2025.

Overall, mobile phones became very popular and landlines became less popular. In the beginning landline was higher, but at the end mobile phone was much more higher than landline.

Band 7

183 words

Clear overview including the crossover · key features logically presented · good cohesive range · appropriate vocabulary · frequent error-free sentences with one tense slip.

The line graph compares the number of mobile phone and landline subscriptions per 100 people in a particular country over a thirty-year period from 1995 to 2025.

Overall, mobile phone subscriptions rose dramatically and overtook landlines early in the period, while landline subscriptions declined after an initial small increase. By the end of the period, there were far more mobile subscriptions than landline ones.

In 1995, landlines were clearly more common, with 48 subscriptions per 100 people compared with only 6 for mobile phones. Landline subscriptions reached their peak of 52 in 2000, but then fell steadily, dropping to 33 in 2015 and to just 17 by 2025, about a third of their highest level.

Mobile phone subscriptions, on the other hand, grew extremely rapidly in the first fifteen years. They reached 38 in 2000 and overtook landlines at some point between 2000 and 2005, when the figure had risen to 82. By 2010 the number had exceeded 100 per 100 people, meaning there were more subscriptions than people. After this, the growth has slowed down, with the figure reaching 131 in 2025.

Band 8

182 words

Key features skilfully selected, including the crossover and later levelling off · clear, well-placed overview · accurate figures and derived fraction · wide, precise vocabulary · varied, error-free structures.

The graph tracks mobile phone and landline subscriptions per 100 people in one country between 1995 and 2025.

The two forms of telephone service moved in opposite directions. Mobile subscriptions expanded rapidly, overtaking landlines in the early 2000s and eventually exceeding the size of the population, whereas landline subscriptions, after peaking in 2000, fell steadily for the remainder of the period.

At the beginning of the period, landlines were far more widespread, with 48 subscriptions per 100 people against a mere 6 for mobiles. Landline numbers rose marginally to 52 in 2000 but declined thereafter, gradually at first and then more sharply, dropping to 33 in 2015 and to just 17 by 2025, less than a third of their peak.

Mobile subscriptions, by contrast, soared in the first decade, climbing to 38 in 2000 and then to 82 in 2005, by which point they had clearly surpassed landlines. Growth continued strongly until 2010, when the figure reached 110, meaning subscriptions outnumbered people. From then on, growth slowed markedly, with the rate increasing only modestly to 124 in 2015 and 131 in 2025.

☐ Approved ☐ Needs changes Notes:

Students by subject area and sex, 2023

id wb1_bar_01

The bar chart below shows the percentage of male and female students enrolled in five subject areas at a university in 2023.

Band 6

169 words

All key figures accurate · overview present but placed at the end · mechanical linking (Also, So, On the other hand) · repetitive vocabulary · several agreement and article errors that do not block meaning.

The bar chart illustrates the proportion of male and female students who were studying in five different subject areas at one university in 2023.

In Engineering, male students were the clear majority with 78%, while female students were only 22%. Business also had more male than female, 55% compared to 45%. So these two subjects were more popular with men than with women.

On the other hand, women were the bigger group in other three subjects. In Education, 74% of the students were female and only 26% were male, and this is the biggest difference after Engineering. Also, in Arts the percentage of female was 62% and the percentage of male was 38%. Medicine was the most balanced subject, with 56% women and 44% men, so the numbers were quite close.

Overall, it is clear that men dominated in Engineering and Business, whereas women were more common in Education, Arts and Medicine. The biggest gap between the two sexes was in Engineering and the smallest gap was in Medicine.

Band 7

177 words

Clear overview of main differences · key features well highlighted and logically grouped · good range of linking · some less common collocations · mostly error-free sentences with one minor slip.

The chart compares the proportions of male and female students across five subject areas at a university in 2023.

Overall, men outnumbered women in Engineering and Business, while the reverse was true in the remaining three subjects. The most striking gender imbalance was found in Engineering, whereas Medicine had the most even distribution.

Engineering was heavily dominated by male students, who made up 78% of the total, compared with just 22% for females. Business showed a similar pattern, although the gap was far narrower, with men accounting for 55% and women for 45%. These were therefore the only two subjects in which male students formed the majority.

In contrast, female students were in the majority in Education, Arts and Medicine. Education had the highest proportion of women at 74%, nearly three times the figure for men (26%). In Arts, women represented 62% of students, while the male share stood at 38%. Medicine was the most balanced of all the subjects, with female students making up 56% and males 44%, a difference of only 12 percentage point.

Band 8

182 words

Key features skilfully selected · clear, well-placed overview · figures used selectively for comparison · cohesion managed smoothly · precise, flexible vocabulary · wide range of structures, virtually error-free.

The bar chart illustrates how male and female students were distributed across five fields of study at a particular university in 2023.

It is immediately apparent that the gender balance varied considerably by subject. Men formed the majority in only two areas, Engineering and Business, while women predominated in the other three. The disparity was most pronounced in Engineering and least marked in Medicine.

Engineering stood out as an overwhelmingly male field: 78% of its students were men, more than three and a half times the proportion of women (22%). Business also had a male majority, but a modest one, at 55% against 45%.

Female students, by contrast, clearly dominated Education, where they accounted for almost three-quarters of enrolments (74%), leaving men with just 26%. Arts followed a similar though less extreme pattern, with women comprising 62% of the cohort and men 38%. Medicine came closest to parity; female students held only a slight edge there, making up 56% of the total compared with 44% for their male counterparts. Engineering and Education therefore represented opposite extremes in terms of gender composition.

Average weekly household spending, 1990-2020

id wb1_bar_02

The chart below shows average weekly household spending on five categories in one country in 1990, 2005 and 2020.

Band 6

167 words

Figures accurate and all categories covered · overview only at the end and basic · linking mechanical and repetitive · adequate vocabulary · several tense and word-form errors that do not impede meaning.

The chart gives information about how much money households in one country spend each week on five categories in 1990, 2005 and 2020.

Housing was the biggest spending in all three years. In 1990 it was \$95 per week, then it increased to \$150 in 2005 and reached to \$240 in 2020. Food was the second in 1990 with \$80, and it also rise steadily to \$95 and then to \$110.

Transport and leisure went up as well. Spending on transport was \$55 in 1990 but it grew to \$85 in 2005 and \$105 in 2020, so it almost doubled. Leisure increase from \$40 to \$70 and then to \$90. On the other hand, clothing was different because it was quite stable. It went up a little to \$38 in 2005 but after that it dropped to \$30, which is the lowest figure in the chart.

Overall, spending on most of categories increased over the period, especially housing, while spending on clothing decreased slightly at the end.

Band 7

190 words

Clear overview of main trends · key changes highlighted with accurate figures · logical progression and varied linking · some less common vocabulary · mostly error-free with one minor article slip.

The bar chart illustrates the average amount that households in a particular country spent per week on five categories of goods and services in 1990, 2005 and 2020.

Overall, weekly expenditure rose in four of the five categories, with housing showing by far the largest increase and remaining the biggest expense throughout. Clothing was the only category in which spending fell over the period as a whole.

Housing was already the most expensive item in 1990, at \$95 a week, and it climbed to \$150 in 2005 before reaching \$240 in 2020, around two and a half times the original figure. Spending on food grew at a much slower pace, from \$80 to \$95 and then to \$110, so the gap between food and housing widened considerably.

Transport and leisure followed similar upward trends. Weekly transport costs nearly doubled, increasing from \$55 to \$105, while the amount spent on leisure more than doubled, going from \$40 in 1990 to \$90 in 2020. In contrast, clothing expenditure remained fairly stable, rising marginally to \$38 in 2005 before falling back to \$30, making it the smallest category at the end of period.

Band 8

200 words

Well-selected key features and a clear overview · accurate figures used for meaningful comparison · seamless cohesion · precise, natural vocabulary · wide range of structures with no noticeable errors.

The chart compares the average weekly sums spent by households in one country on housing, food, transport, leisure and clothing at three points between 1990 and 2020.

The most notable feature is the sharp and sustained rise in housing costs, which were consistently the largest outlay and grew far faster than any other item. Expenditure on food, transport and leisure also increased steadily, whereas clothing was the sole category to decline.

In 1990, households spent \$95 a week on housing, only marginally more than the \$80 devoted to food. Over the following three decades, however, the two diverged markedly: housing costs rose to \$150 in 2005 and \$240 in 2020, an increase of \$145, while spending on food edged up to just \$110. By the end of the period, therefore, households were spending more than twice as much on housing as on food.

Transport and leisure registered comparable growth. Transport spending almost doubled from \$55 to \$105, bringing it close to the level of food, and leisure spending more than doubled, climbing from \$40 to \$90. Clothing, by contrast, barely changed, increasing slightly to \$38 in 2005 before slipping to \$30 in 2020, the lowest figure recorded for any category.

Adult participation in sports and exercise, 2008 and 2023

id wb1_bar_03

The bar chart below shows the percentage of adults in one country who took part in six sports and exercise activities in 2008 and 2023.

**Band 6**

162 words

Figures accurate and all activities covered · overview present but basic and placed last · list-like, mechanical presentation · limited vocabulary · several verb-form and article errors that do not block meaning.

The bar chart shows the percentage of adults in one country who did six different sports and exercise activities in 2008 and in 2023.

In 2008 swimming was the most popular activity with 21% of adults. Gym was second with 14%, and then cycling was 11%, football 10% and running 9%. Yoga was the less popular, only 3% of people did it.

In 2023 the situation was changed. Gym become the most popular activity with 24%, and swimming decreased to 13%. The biggest change was in gym, which rose by 10 percentage points. Running also increased a lot, from 9% to 17%, so it almost doubled. Yoga went up to 11%, which is a big increase. Cycling was nearly same, it was 11% and 12%. However, football fell from 10% to 7%.

Overall, the gym, running and yoga became more popular between 2008 and 2023, but swimming and football was less popular than before. Cycling did not change much in this period.

Band 7

173 words

Clear overview identifying the main shift · key features well highlighted and grouped · good range of cohesive devices · some less common collocations · frequent error-free sentences with one minor slip.

The chart compares the proportion of adults in a particular country who participated in six sports and fitness activities at least once a month in 2008 and 2023.

Overall, the gym overtook swimming as the most popular activity over the 15-year period. Participation in gym workouts, running and yoga rose considerably, whereas swimming and football became less popular and cycling remained almost unchanged.

In 2008, swimming was clearly the leading activity, attracting 21% of adults, followed by the gym at 14%. By 2023, however, their positions had been reversed: the figure for gym use climbed to 24%, while swimming dropped by 8 percentage points to 13%. Running showed a similarly impressive rise, almost doubling from 9% to 17%, and yoga, which had been the least popular activity in 2008 with only 3%, grew to 11%.

Football was the only other activity to see a decline, with participation falling from 10% to 7%. Cycling, meanwhile, was remarkably stable, being the choice of 11% of adult in the first year and 12% in the second.

Band 8

175 words

Key features skilfully selected with a well-placed overview · accurate, selective figures for comparison · cohesion managed effortlessly · wide, precise vocabulary · varied structures, error-free.

The bar chart shows what percentage of adults in one country engaged in six forms of sport and exercise at least monthly, comparing 2008 with 2023.

The period saw a clear shift in preferences: gym-based exercise replaced swimming at the top of the ranking, and running and yoga also gained substantially in popularity. Swimming and football, on the other hand, lost ground, while cycling held steady.

Swimming was the most widely practised activity in 2008, with 21% of adults taking part, but by 2023 this had fallen to 13%. Over the same period, gym participation rose from 14% to 24%, making it comfortably the most common activity by the end of the period.

Among the remaining activities, the growth in running was particularly striking, with the proportion of participants nearly doubling from 9% to 17%. Yoga saw the sharpest relative increase of all, more than tripling from a mere 3% to 11%. By contrast, football declined modestly from 10% to 7%, and cycling was virtually unchanged, edging up by a single percentage point to 12%.

Main method of travel to work in four cities

id wb1_bar_04

The chart below shows the main methods of travelling to work used by residents of four cities.

Band 6

164 words

All figures accurate · overview basic and only at the end · city-by-city listing with mechanical linking · repetitive vocabulary · several article, agreement and tense errors that do not block meaning.

The chart show the main ways which people in four cities use to go to their work.

In Northport, the car is the most common method with 62%. Public transport is 20%, walking is 12% and cycling is only 6%, which is the lowest number in the chart. In Arden the car is also the most popular, 45% of workers use it. Then there is public transport with 25%, cycling with 20% and walking with 10%.

However, Kelby and Southam are different. In Kelby the public transport is most popular with 48% and the car is only 30%. Cycling and walking are 12% and 10%. In Southam, cycling is the main method, because 45% of the workers are cycling to work. Public transport is 22%, car is 18% and walking is 15%.

Overall, the car is popular in Northport and Arden, but in Kelby people prefer public transport and in Southam they prefer bicycle. Walking was not very popular in any of the city.

Band 7

188 words

Clear overview of each city's dominant mode · key features well highlighted and compared · logical organisation with a range of linkers · good collocations · mostly error-free with one minor slip.

The bar chart compares the proportions of workers in four cities who used the car, public transport, cycling or walking as their main way of commuting.

Overall, the dominant form of transport varied from city to city. Driving was the most common choice in Northport and Arden, whereas public transport and cycling were the most popular in Kelby and Southam respectively. Walking, by comparison, was a minor option everywhere.

Northport had the highest reliance on cars, with 62% of workers driving to work, followed by public transport at 20%. Only 6% of commuters there cycled, the lowest figure for any method in the four city. Arden showed a similar but less extreme pattern: 45% travelled by car, while a quarter used public transport and a further 20% cycled.

In Kelby, by contrast, nearly half of the workforce (48%) took public transport, compared with 30% who drove. Southam was notable for its cyclists, who made up 45% of commuters, while cars accounted for only 18%, the smallest share in any of the cities. Walking was consistently low, ranging between 10% and 15%, with the highest proportion recorded in Southam.

Band 8

186 words

Key features skilfully selected · clear, well-placed overview · figures used selectively to compare cities · cohesion managed well · wide, precise vocabulary · varied, error-free structures.

The chart illustrates how commuters in four cities, Northport, Kelby, Arden and Southam, chose to travel to work, broken down into four modes of transport.

What stands out is that each city had a distinctive commuting profile. Cars were the principal means of travel in Northport and Arden, but public transport led in Kelby and cycling in Southam. Walking, meanwhile, played a relatively small role in all four cities.

Northport was by far the most car-dependent city, with 62% of its workers driving, roughly three times the proportion using public transport (20%). Cycling was almost negligible there, at just 6%. Arden also favoured the car, though less heavily, at 45%, and it had a more even spread across the other modes, with 25% using public transport and 20% cycling.

Kelby and Southam presented a sharp contrast. In Kelby, public transport was the choice of 48% of commuters, well ahead of the car at 30%, while in Southam cycling accounted for 45%, making driving (18%) a relatively minor option. Walking figures were broadly similar throughout, ranging from 10% in Kelby and Arden to 15% in Southam.

Renewable electricity generation, 2022

id wb1_bar_05

The bar chart below shows the amount of electricity generated from renewable sources in six countries in 2022.

Band 6 187 words

Accurate figures for every country · overview present but brief and at the end · mechanical sequencing (Finally) · some awkward word choice · agreement, tense and punctuation errors that do not block meaning.

The bar chart show how much electricity six countries produced from three renewable sources, which are hydro, wind and solar, in 2022.

Country A produced the most electricity. It generated 380 TWh from hydro, and this is much more than any other country. Its wind and solar was 70 and 40 TWh. Country E also used mainly hydro power with 140 TWh, but it had very little wind (15 TWh) and solar (5 TWh).

In Country B and Country D wind was the biggest source. Country B made 120 TWh of wind, 95 TWh of hydro and 60 TWh of solar. Country D produced 110 TWh from wind but only 20 TWh from hydro and 35 from solar.

Finally, solar was the most important in Country C and Country F. Country C had 90 TWh of solar, it is the highest solar figure, and Country F had 60 TWh. Country F produced only 8 TWh of hydro, which was the lowest in the chart.

Overall, hydro was the main source in Country A and E, but the other countries depend more on wind or solar power.

Band 7

204 words

Clear overview grouping countries by main source · key features highlighted with accurate comparisons · logical progression and varied linking · good range of vocabulary · one minor agreement slip.

The chart compares the quantity of electricity that six countries generated from hydro, wind and solar power in 2022.

Overall, Country A generated far more renewable electricity than the other countries, mainly from hydro power. Each country tended to depend on one main source: hydro in Countries A and E, wind in B and D, and solar in C and F.

Country A's hydro output of 380 TWh was the highest figure on the chart and more than two and a half times that of Country E, the second-largest hydro producer at 140 TWh. Country A also generated 70 TWh from wind and 40 TWh from solar. In contrast, Country E produced very little from the other two sources, with only 15 TWh and 5 TWh respectively.

Wind was the leading source in Country B, at 120 TWh, and Country D, at 110 TWh, while hydro contributed 95 TWh and 20 TWh in these countries. As for solar, Country C generated the most, 90 TWh, which were considerably higher than its hydro (60 TWh) and wind (25 TWh) figures. Country F was the smallest producer overall, relying mostly on solar (60 TWh) and wind (45 TWh), with a hydro output of just 8 TWh.

Band 8

205 words

Skilful selection of key features, including a derived comparison · clear, well-placed overview · figures used precisely · cohesion managed well · wide, natural vocabulary · complex structures, error-free.

The bar chart provides a breakdown of renewable electricity generation in six countries in 2022, distinguishing between hydro, wind and solar power.

The most striking feature is the dominance of Country A, whose hydroelectric output alone exceeded the total renewable generation of any other country. Beyond this, the countries fall into three pairs according to their principal source: hydro in A and E, wind in B and D, and solar in C and F.

Country A generated 380 TWh from hydro, supplemented by a relatively modest 70 TWh from wind and 40 TWh from solar. Country E shared this reliance on hydro, producing 140 TWh, but its wind and solar output was minimal, at 15 TWh and a mere 5 TWh.

Wind was the leading source in Countries B and D, which generated 120 TWh and 110 TWh respectively. However, Country B had a far more balanced mix, with substantial hydro output (95 TWh), whereas Country D relied on hydro for only 20 TWh. Solar power, meanwhile, was most significant in Country C, reaching 90 TWh, the highest solar figure among the six countries, and in Country F, where it produced 60 TWh. Country F also recorded the lowest hydro figure overall, just 8 TWh.

Employment by sector, 2022

id wb1_bar_06

The chart below shows the proportion of workers employed in agriculture, industry and services in four countries in 2022.

Band 6

164 words

Figures accurate and all countries described · simple overview at the end · repetitive structures and linking · some inaccurate word choice · several agreement, comparative and tense errors that do not impede meaning.

The chart gives the information about the percentage of workers who work in agriculture, industry and services in Vietnam, Mexico, Poland and Canada in 2022.

In Vietnam, the three sectors are quite similar. Services is 37%, agriculture is 33% and industry is 30%. So the workers is divided almost equally. Vietnam also has the highest agriculture of all four countries.

In Mexico and Poland, services is much more bigger than the other sectors. Mexico has 62% in services, 26% in industry and 12% in agriculture. Poland is similar with 60% in services, but industry is higher at 32%, which is the highest percentage for industry. Agriculture in Poland is only 8%.

Canada has the most workers in services, it is 79%. Industry is 19% and agriculture is only 2%, which is the lowest figure in the chart.

Overall, services was the biggest sector in every country, while agriculture was small in all countries except Vietnam, where it was nearly one third of the workers.

Band 7

184 words

Clear overview of the main pattern · key features highlighted with apt comparisons · logical paragraphing and a range of linkers · some less common vocabulary · mostly accurate grammar with one agreement slip.

The bar chart illustrates the proportion of the workforce employed in three economic sectors, namely agriculture, industry and services, in four countries in 2022.

Overall, the service sector was the largest employer in all four countries, although its dominance varied considerably. Vietnam had a much more even distribution of workers than the other countries, while agriculture accounted for only a small share of jobs in Mexico, Poland and Canada.

In Vietnam, employment was split fairly evenly, with 37% of workers in services, 33% in agriculture and 30% in industry. Its agricultural figure was far higher than those of the other nations, being almost three times that of Mexico (12%).

Mexico and Poland had very similar profiles, with services employing 62% and 60% of their workforces respectively. However, industry was slightly more significant in Poland, where it accounted for 32%, the highest figure for this sector, compared to 26% in Mexico. Canada was the most service-oriented economy, with almost four-fifths of workers (79%) in this sector. Only 19% of Canadians worked in industry, and just 2% was employed in agriculture, the lowest proportion recorded.

Band 8

183 words

Well-chosen key features and a clear overview · accurate figures and derived comparisons · skilful organisation from most balanced to most service-based · precise vocabulary · wide range of error-free structures.

The chart compares the distribution of employment across agriculture, industry and services in Vietnam, Mexico, Poland and Canada in 2022.

In every country, services provided the largest share of jobs, but the extent of this varied markedly. Vietnam stood apart as the only country with a substantial agricultural workforce and a roughly even three-way split, whereas Canada's economy was overwhelmingly service-based.

Vietnam's workers were distributed almost equally between the three sectors: 37% were in services, 33% in agriculture and 30% in industry. Its agricultural share was nearly three times that of Mexico and more than sixteen times that of Canada.

Mexico and Poland occupied the middle ground, with services employing around three-fifths of workers in each (62% and 60% respectively). The two differed mainly in the balance between the other sectors: Poland had the largest industrial workforce of the four countries, at 32%, and only 8% in agriculture, while Mexico's figures were 26% and 12%.

At the other extreme, Canada had 79% of its workforce in services, the highest proportion shown, leaving just 19% in industry and a negligible 2% in agriculture.

Average graduate salaries by field

id wb1_bar_07

The bar chart below shows the average annual salaries of university graduates in six fields one year and five years after graduation.

Band 6

179 words

Overview present and figures accurate · key features covered but presented as a list · repetitive linking and vocabulary · tense, agreement and punctuation errors that do not reduce clarity.

The bar chart shows the average salary per year of university graduates in six different fields, after one year and after five years of graduation.

Overall, the salaries in all fields were higher after five years than after one year. Computing had the highest salary in both time and fine art had the lowest.

One year after graduation, computing graduates earned \$48,000 and engineering graduates earned \$45,000. Nursing was \$38,000, law was \$36,000 and teaching was \$33,000. Fine art graduates earn only \$22,000.

After five years, computing was still the highest with \$78,000. Law increased very much to \$70,000, so it become the second highest and it was higher than engineering, which was \$66,000. The other fields increased less. Nursing went up to \$47,000 and teaching to \$42,000, while fine art was \$30,000, it is still much lower than the others.

In conclusion, all graduates earn more money after five years, but the increase for computing and law were bigger than for nursing, teaching and fine art.

Band 7

188 words

Clear overview including the key change in ranking · main features well highlighted with accurate comparisons · good cohesion · some less common vocabulary · one minor article slip.

The chart compares the average yearly earnings of graduates from six fields of study at two stages of their careers: one year and five years after they graduated.

Overall, salaries rose in every field over this period, with computing graduates earning the most at both stages and fine art graduates the least. The most dramatic growth was seen in law, which moved from fourth to second place.

In the first year after graduation, computing and engineering graduates were the highest earners, receiving \$48,000 and \$45,000 respectively. Nursing graduates earned \$38,000, slightly more than those in law (\$36,000) and teaching (\$33,000), while fine art graduates received just \$22,000.

Five years later, the average salary in computing had risen by \$30,000 to \$78,000. Law salaries almost doubled to reach \$70,000, overtaking engineering, which grew more modestly to \$66,000. In comparison, increases in the remaining fields were relatively small: nursing and teaching salaries both went up by \$9,000, to \$47,000 and \$42,000, while the figure for fine art increased to \$30,000, remaining the lowest by considerable margin.

Band 8

200 words

Key features skilfully selected, including the widening gap · clear overview · figures used selectively with accurate derived comparisons · fluent cohesion · precise vocabulary · varied, error-free grammar.

The chart shows the average annual salaries earned by graduates in six disciplines at two points in their careers: one year and five years after graduating.

All six groups saw their earnings rise over the four-year interval, but the scale of the increase varied widely. Computing graduates were the best paid at both stages, while those who had studied fine art consistently earned the least. Law stood out for the speed of its salary growth.

One year after graduation, computing (\$48,000) and engineering (\$45,000) led the way, with nursing, law and teaching clustered in the thirties (\$38,000, \$36,000 and \$33,000 respectively). Fine art trailed well behind at \$22,000.

By the five-year point, the gap between the higher- and lower-paid fields had widened considerably. Computing salaries had climbed to \$78,000, and law graduates, whose pay nearly doubled to \$70,000, had overtaken engineers, who were earning \$66,000. In contrast, the gains for nursing and teaching were comparatively modest, at \$9,000 each, bringing their averages to \$47,000 and \$42,000. Fine art graduates remained at the bottom of the scale, earning \$30,000, less than 40% of the figure for computing.

Visitors to city attractions, 2010 and 2020

id wb1_bar_08

The chart below shows the number of visitors to five tourist attractions in a city in 2010 and 2020.

Band 6

175 words

All figures accurate · overview present but placed at the end · year-by-year listing with simple linking · some informal or awkward word choices · verb-form and quantifier errors that do not block meaning.

The chart shows how many people visited five tourist attractions in a city in the years 2010 and 2020.

In 2010, the castle was the most popular attraction with 640,000 visitors. The science museum had 410,000 visitors and the aquarium had 350,000. The botanic gardens and the art gallery had less visitors, 280,000 and 190,000.

In 2020, some attractions became more popular and some became less popular. The science museum increase a lot to 590,000, and it become the most visited place. The art gallery also went up to 260,000 and the botanic gardens rose slightly to 300,000. On the other hand, the castle visitors fell down to 520,000. The biggest change was the aquarium, which dropped from 350,000 to only 150,000, so it was the least popular attraction in 2020.

Overall, the science museum, the art gallery and the botanic gardens got more visitors, but the castle and the aquarium got less. The science museum replaced the castle as the most popular attraction.

Band 7

182 words

Clear overview of rises, falls and the change at the top · key features highlighted with accurate figures · logical grouping and cohesive devices · good collocations · one minor article slip.

The bar chart compares the number of people who visited five attractions in a city in 2010 and 2020.

Overall, the science museum, the botanic gardens and the art gallery all attracted more visitors over the decade, while visitor numbers at the castle and the aquarium declined. As a result, the science museum replaced the castle as the city's most popular attraction.

In 2010, the castle was clearly the most visited site, with 640,000 visitors, followed by the science museum at 410,000. However, by 2020 the castle's figure had fallen to 520,000, whereas the science museum saw a significant rise to 590,000. The art gallery also became more popular, with visitor numbers increasing by 70,000 to 260,000, and the botanic gardens experienced a slight growth, from 280,000 to 300,000.

The most dramatic change took place at the aquarium. Having attracted 350,000 people in 2010, it welcomed only 150,000 in 2020, a fall of more than half, which meant it went from being the third most popular attraction to the least popular one.

Band 8

196 words

Key features skilfully selected and logically grouped · clear overview · figures used selectively with accurate derived changes · cohesion managed well · wide, precise vocabulary · error-free complex sentences.

The chart illustrates visitor numbers at five of a city's tourist attractions in 2010 and 2020.

Over the ten-year period, the popularity of the attractions shifted noticeably. The science museum overtook the castle to become the most visited site and the aquarium suffered a steep decline, whereas the botanic gardens and the art gallery both gained visitors.

The castle attracted 640,000 visitors in 2010, the highest figure for either year, but this dropped by 120,000 to 520,000 in 2020. Over the same period, the science museum enjoyed the largest increase of any attraction, with visitor numbers climbing by 180,000, from 410,000 to 590,000, which made it the clear leader by the end of the decade.

The aquarium's decline was even more pronounced than the castle's. Its visitor numbers fell from 350,000 to just 150,000, less than half the original figure, leaving it with the smallest audience of all five attractions by 2020. By contrast, the art gallery grew from 190,000 to 260,000, while the botanic gardens remained relatively stable, rising marginally from 280,000 to 300,000, and consequently moved above the aquarium in the rankings.

CO₂ emissions per person, 1990 and 2020

id wb1_bar_09

The bar chart below shows carbon dioxide emissions per person in eight countries in 1990 and 2020.

**Band 6**

164 words

Accurate figures and a basic overview at the end · information listed rather than grouped · mechanical linking · limited range of vocabulary · article, agreement and tense errors that do not impede meaning.

The bar chart shows how much carbon dioxide each person produced in eight countries in 1990 and 2020.

In 1990, USA had the highest emissions with 19.4 tonnes per person, and Australia was second with 16.2 tonnes. Germany and UK were 12.8 and 10.0 tonnes. The other four countries were much lower. China was 2.0 tonnes, Brazil 1.5, Nigeria 0.9 and India only 0.7 tonnes.

In 2020, the emissions in the first four countries goes down. The USA fell to 14.2 tonnes and Australia fell slightly to 15.0, so Australia became the highest. Germany decreased to 7.7 tonnes and UK decreased to 4.9, which is about half. However, China increase very much from 2.0 to 7.6 tonnes, it is almost the same like Germany. Brazil and India also rose a little to 2.1 and 1.7 tonnes. Only Nigeria went down to 0.6 tonnes.

Overall, the emissions per person fell in USA, Australia, Germany, UK and Nigeria, but it rose in China, Brazil and India.

Band 7

196 words

Clear overview of opposing trends · key features highlighted with apt comparisons · well-organised paragraphs and varied linking · some less common vocabulary · one minor article slip.

The chart compares carbon dioxide emissions per person in eight countries in 1990 and 2020.

Overall, the four countries with the highest emissions in 1990, namely the USA, Australia, Germany and the UK, all reduced their per capita figures over the period, while emissions rose in China, Brazil and India. Despite these changes, the USA and Australia remained the largest emitters.

In 1990, an average American produced 19.4 tonnes of carbon dioxide, the highest figure on the chart, followed by an average Australian at 16.2 tonnes. By 2020, the US figure had dropped considerably to 14.2 tonnes, while Australia's fell only slightly to 15.0 tonnes, making it the top emitter. Germany and the UK recorded even sharper decreases, from 12.8 to 7.7 tonnes and from 10.0 to 4.9 tonnes respectively, meaning the UK's emissions more or less halved.

The opposite trend can be seen in China, where emissions per person rose from just 2.0 tonnes to 7.6 tonnes, almost equal to Germany's level. Brazil and India also saw increase, to 2.1 and 1.7 tonnes, although their emissions remained low. Nigeria was the exception among the lower emitters, with its figure falling from 0.9 to 0.6 tonnes.

Band 8

204 words

Key features skilfully selected around a clear divergence · well-placed overview · precise figures and derived comparisons · cohesion seamless · wide, accurate vocabulary · complex structures used flexibly and without error.

The bar chart compares per capita carbon dioxide emissions in eight countries in 1990 and 2020.

The chart reveals a clear divergence between two groups of countries. The four highest emitters of 1990, the USA, Australia, Germany and the UK, all cut their emissions per person over the thirty years, whereas China, Brazil and India recorded increases. China's growth was by far the most dramatic.

In 1990, emissions were highest in the USA, at 19.4 tonnes per person, and Australia, at 16.2 tonnes. Although both figures had fallen by 2020, the reduction was far greater in the USA (to 14.2 tonnes) than in Australia (to 15.0 tonnes), so Australia ended the period with the highest per capita output. Germany and the UK achieved the steepest cuts: Germany's figure fell from 12.8 to 7.7 tonnes, and the UK's roughly halved, from 10.0 to 4.9 tonnes.

China, by contrast, saw its emissions per person almost quadruple, rising from 2.0 to 7.6 tonnes and very nearly drawing level with Germany. Increases in Brazil (1.5 to 2.1 tonnes) and India (0.7 to 1.7 tonnes) were much smaller in absolute terms, and Nigeria's figure actually fell slightly, from 0.9 to 0.6 tonnes, the lowest on the chart in 2020.

Weekly online shoppers by age group, 2015 and 2025

id wb1_bar_10

The bar chart below shows the percentage of people in five age groups in one country who shopped online at least once a week in 2015 and 2025.

Band 6

179 words

Figures accurate with some relevant comparison · overview present but placed last · linking simple and repetitive · adequate vocabulary · several agreement, tense and punctuation errors that do not block meaning.

The bar chart shows the percentage of people in different age groups in one country who shopped online every week in 2015 and 2025.

In 2015, the 25-34 age group had the highest percentage with 38%. The 16-24 group was 31% and the 35-49 group was 29%. Older people shopped online less. Only 16% of people aged 50-64 and 5% of people over 65 was shopping online weekly.

In 2025, all of the age groups increased. The 25-34 group was still the highest, it rose to 68%. The 35-49 group more than doubled to 61%, so it was higher than the 16-24 group, which only reach 52%. The biggest change was in the older groups. The 50-64 group went up to 47%, almost three times more than before, and the over 65 group rose from 5% to 32%.

Overall, online shopping become more popular in every age group, and the young adults aged 25-34 shopped online the most in both year. Older people were the least, but they increased quickly.

Band 7

193 words

Clear overview of overall growth and the narrowing gap · key features well highlighted · logical progression with good linking · some less common expressions · mostly accurate with one or two awkward phrasings.

The bar chart compares the proportion of people in five age groups in a particular country who made online purchases at least weekly in 2015 and 2025.

Overall, weekly online shopping became considerably more common among all age groups over the decade. People aged 25–34 were the most frequent online shoppers in both years, whereas those aged 65 and over were the least, although the older groups saw the most rapid growth.

In 2015, 38% of 25–34-year-olds shopped online every week, slightly more than the 16–24 and 35–49 groups, at 31% and 29% respectively. Participation was much lower among older people, with just 16% of those aged 50–64 and only 5% of the over-65s doing so.

By 2025, the figure for the 25–34 group had increased by 30 percentage points to 68%. The 35–49 age group more than doubled its share to 61%, overtaking the youngest group, which rose more modestly to 52%. The most striking growth, however, occurred among older people: the proportion of 50–64-year-olds almost tripled to 47%, and the figure for those over 65 went up more than six times, reaching 32%.

Band 8

193 words

Skilful selection of key features, including relative growth · clear overview · accurate figures and derived comparisons · cohesion well managed · precise, varied vocabulary · wide range of error-free structures.

The chart shows the percentage of people in five age brackets in one country who shopped online at least once a week in 2015, compared with 2025.

The habit of weekly online shopping spread across every age group over the ten years. The 25–34 group remained the most active throughout, but the gap between younger and older shoppers narrowed considerably, as the steepest proportional rises were among the over-50s.

In 2015, weekly online shopping was concentrated among those aged under 50, with rates ranging from 29% in the 35–49 group to 38% among 25–34-year-olds. The figures for older people were far lower: 16% for the 50–64 group and a mere 5% for those aged 65 and above.

A decade later, the 25–34 group still led, with more than two-thirds (68%) shopping online weekly. The 35–49 age group had more than doubled its rate to 61%, overtaking 16–24-year-olds, whose participation grew by a comparatively modest 21 points to 52%. Meanwhile, the proportion of 50–64-year-olds nearly tripled to 47%, and the over-65s recorded the most remarkable change of all, rising more than sixfold from 5% to 32%.

Reasons for taking evening courses, by age

id wb1_bar_11

The chart below shows the main reasons given by adults of different ages for taking part-time evening courses at a college.

Band 6

177 words

Figures accurate and all groups covered · short, basic overview at the end · mechanical, repetitive sentence patterns · limited vocabulary · agreement and punctuation errors that do not impede meaning.

The chart shows why adults in three age groups take part-time courses in the evening at a college.

For the under 30 group, the main reason is career progression with 42%. Change of career is 26% and personal interest is 15%. Only 12% say their employer require it and 5% want to meet people.

The 30-50 group is quite similar to the younger group. Career progression is 30% and change of career is 28%, so they are nearly the same. Personal interest is 20% and required by employer is 18%, which is the highest for this reason. Meet people is the lowest at 4%.

However, the over 50 group is very different. More than half of them, 55%, study because of personal interest. Also, 20% of them want to meet people, which is much higher than the other groups. Career reasons is less important for them, change of career is 12%, career progression is 8% and required by employer is only 5%.

Overall, younger learners mostly study for their job, but older learners study for interest.

Band 7

203 words

Clear overview contrasting work-related and personal motives · key features highlighted and compared across groups · good cohesion · some less common vocabulary · generally accurate with a minor slip.

The bar chart compares the main motivations of three age groups of adults for enrolling in part-time evening courses at a college.

Overall, learners under 50 were mainly motivated by work-related reasons, whereas those over 50 studied primarily out of personal interest. Meeting people was a relatively unimportant reason for all groups except the oldest.

Career progression was the most common reason among learners under 30, cited by 42%, and it was also the top reason for the 30–50 group, although at a lower 30%. For both of these groups, changing career was the second most important factor, at 26% and 28% respectively. Being required by an employer was mentioned by 12% of the youngest learners and 18% of the middle group, while personal interest accounted for 15% and 20%.

The pattern for over-50s was completely different. More than half of this group (55%) took courses for personal interest, and a further 20% wanted to meet people, which was four times the figure for under-30s and five times that for the 30–50 group. By contrast, only 8% of older learners wanted to progress in their careers, 12% hoped to change career and just 5% were required to study by their employer.

Band 8

198 words

Key features skilfully selected around a clear generational contrast · well-placed overview · selective, accurate figures · sophisticated cohesion · wide, precise vocabulary · varied complex structures without error.

The chart illustrates the reasons adults in three age brackets gave for attending part-time evening courses at a college.

A clear generational divide is evident. For learners under 50, the main motivations were professional, with career progression and career change dominating, whereas the over-50s were driven predominantly by personal interest and, to a lesser extent, the opportunity to socialise.

Among those under 30, career progression was by far the leading reason, given by 42%, followed by a change of career (26%). The 30–50 age group showed a similar but more evenly balanced profile: career progression (30%) and career change (28%) were almost equally important, and this group was also the most likely to be studying at an employer's request (18%). Personal interest was a secondary motive for both groups, at 15% and 20%, and very few learners in either group mentioned meeting people.

For the over-50s, the picture was reversed. Personal interest accounted for 55% of responses, more than the three work-related reasons combined, and 20% saw the courses as a way to meet people. Career-related reasons, meanwhile, were marginal: only 8% cited career progression, 12% a change of career and 5% an employer requirement.

Daily domestic water use per person

id wb1_bar_12

The bar chart below compares average daily household water use per person for six activities in two countries.

Band 6

170 words

Figures accurate and key differences identified · overview basic and placed last · country-by-country listing with simple linking · repetitive vocabulary · several agreement and word-choice errors that do not block meaning.

The bar chart compare how many litres of water one person use every day for six activities at home in Country A and Country B.

In Country A, shower and bath use the most water with 68 litres. Toilet is second with 45 litres, and garden is 40 litres. Laundry uses 32 litres, kitchen and drinking 18 litres and other activities 12 litres.

In Country B, people use much less water for all the activities. Shower and bath is also the highest, but it is only 30 litres, which is less than half of Country A. Toilet is 22 litres and laundry is 15 litres. Kitchen and drinking is 14 litres, and this is quite similar to Country A. The biggest difference is garden, because people in Country B only use 3 litres for it, but in Country A it is 40 litres.

Overall, Country A uses more water than Country B for every activity, and shower or bath is the activity which uses the most water in both countries.

Band 7

191 words

Clear overview of main differences · key features presented with accurate comparisons · logical paragraphing and a range of linkers · some less common collocations · mostly error-free with one article slip.

The chart compares the average amount of water used per person each day for six household activities in two countries, A and B.

Overall, people in Country A consumed considerably more water than those in Country B for every activity. In both countries, showering and bathing accounted for the largest amount, while the greatest difference between the two was in garden use.

In Country A, an average of 68 litres per person was used for showers and baths every day, more than twice the figure for Country B (30 litres). Similarly, toilet use and laundry in Country A required 45 and 32 litres respectively, roughly double the corresponding amounts in Country B, at 22 and 15 litres.

The contrast was most striking for gardens. Residents of Country A used 40 litres daily on their gardens, making it the third-largest category there, whereas in Country B the figure was just 3 litres, the lowest of any activity. By comparison, water used for the kitchen and drinking was fairly similar in two countries, at 18 litres and 14 litres, and other uses accounted for 12 litres in A and 6 in B.

Band 8

204 words

Key features skilfully selected using ratios · clear overview · figures grouped efficiently for comparison · cohesion managed well · wide, precise vocabulary · complex sentences handled accurately.

The bar chart compares daily domestic water consumption per person in two countries, broken down into six categories of use.

Residents of Country A used more water than those of Country B in every category, and in most cases around twice as much. Showers and baths were the largest single use in both countries, but the most dramatic disparity concerned gardening, which was a major use of water in Country A yet almost negligible in Country B.

Showering and bathing accounted for 68 litres per person per day in Country A, compared with 30 litres in Country B. A similar ratio applied to toilet use (45 and 22 litres), laundry (32 and 15 litres) and other purposes (12 and 6 litres), all of which were roughly twice as high in Country A.

Garden watering was the notable exception to this pattern. In Country A, it consumed 40 litres per person each day, placing it third among the six activities, whereas the equivalent figure in Country B was a mere 3 litres, the smallest amount on the chart. At the other end of the spectrum, kitchen use and drinking showed the least variation, at 18 litres in Country A and 14 litres in Country B.

New homes completed by type and region, 2023

id wb1_bar_13

The chart below shows the number of new homes completed in four regions of a country in 2023, by type of property.

Band 6

183 words

Figures accurate and every region covered · overview basic and at the end · region-by-region listing with little comparison · repetitive vocabulary · agreement, quantifier and punctuation errors that do not block meaning.

The chart shows how many new homes were built in four regions of a country in 2023, and it divides them into four types of property.

The South had the most new homes, with 55,000 in total. Most of them were apartments, 26,000, and there was also 14,000 detached houses, 9,000 semi-detached and 6,000 terraced houses.

The North and the East both had 29,000 homes. In the North, detached houses was the biggest type with 9,000, then apartments with 8,000, semi-detached 7,000 and terraced 5,000. The East had more detached houses, 11,000, but less apartments, only 6,000. It also built 8,000 semi-detached and 4,000 terraced houses.

The West had the smallest number of homes, 26,000. Apartments were almost half of this number with 12,000. Detached houses was 6,000, semi-detached 5,000 and terraced only 3,000, that is the lowest figure in the chart.

Overall, the South built much more homes than the other regions, and terraced houses were the least common type in every region.

Band 7

197 words

Clear overview of the leading region and least common type · key features compared across regions · logical organisation and good linking · appropriate vocabulary · one minor verb-form slip.

The chart compares the number of new homes completed in four regions of a country in 2023, broken down into detached houses, semi-detached houses, terraced houses and apartments.

Overall, the South completed far more homes than any other region, largely because of its high number of apartments. Terraced houses were the least common type of property in all four regions.

With 55,000 completions, the South built almost twice as many homes as the North or the East, which recorded 29,000 each. Apartments made up nearly half of the South's total, at 26,000, while it also lead the other regions in detached housing, with 14,000 units. In contrast, the North and East were dominated by detached houses, at 9,000 and 11,000 respectively, and had relatively few apartments (8,000 and 6,000).

The West had the lowest total, at 26,000. As in the South, apartments were the most common type there, accounting for 12,000 homes, compared to 6,000 detached and 5,000 semi-detached houses. Terraced homes made up the smallest category across the regions, ranging from only 3,000 in the West to 6,000 in the South.

Band 8

209 words

Key features skilfully selected, including accurate derived comparisons · clear overview · regions grouped logically by housing mix · cohesion well managed · precise vocabulary · wide range of error-free structures.

The chart provides a regional breakdown of new home completions in 2023, distinguishing between four types of property.

The South stood out as by far the most active region, completing almost as many homes as the North and East combined. Apartments were the dominant property type in the South and West, whereas detached houses were most numerous in the North and East. Terraced housing, by contrast, formed the smallest category everywhere.

A total of 55,000 homes were completed in the South, of which 26,000 were apartments, as many as in the other three regions put together. The South also led in detached houses (14,000), semi-detached houses (9,000) and terraced houses (6,000). The West, although it had the lowest overall total at 26,000, followed a broadly similar pattern, with apartments accounting for 12,000 of its new homes.

The North and East each completed 29,000 homes, but their mix was quite different. Detached houses were the largest group in both, at 9,000 and 11,000 respectively, with semi-detached homes close behind (7,000 and 8,000). Apartments were less significant, particularly in the East, where just 6,000 were built, and terraced houses numbered only 5,000 and 4,000.

National park visitors by season, 2021-2023

id wb1_bar_14

The chart below shows the number of visitors to a national park in each season from 2021 to 2023.

Band 6

174 words

Accurate figures, all seasons covered · overview placed at the end · simple, repetitive linking · adequate vocabulary, some informal phrasing · agreement, word-form and tense errors that do not block meaning.

The chart shows how many people visited a national park in the four seasons in 2021, 2022 and 2023.

Summer was the most popular season in all three years. In 2021 there was 210,000 visitors, and it went up to 260,000 in 2022. However, in 2023 it decreased a little bit to 245,000.

Autumn was the second popular season. It had 120,000 visitors in 2021 and 115,000 in 2022, then it rose to 150,000 in 2023.

Spring visitors increased every year. It started at 85,000 in 2021 and rose to 110,000 in 2022 and 140,000 in 2023. Winter was the least popular season, but the number of visitors also grew each year, from 30,000 to 45,000 and then 70,000, so it more than doubled in this period.

Overall, summer had the most visitors and winter had the fewest in all years. The number of visitors in spring and winter increased steady, while in summer and autumn the numbers went up and down.

Band 7

188 words

Clear overview of peak, low and trends · key features well highlighted · logical progression and a range of cohesive devices · some less common vocabulary · generally accurate grammar with one article slip.

The bar chart compares the number of visitors to a national park in spring, summer, autumn and winter over a three-year period from 2021 to 2023.

Overall, summer was consistently the busiest season, while winter attracted the fewest visitors. Numbers in spring and winter increased steadily each year, whereas summer and autumn showed less regular patterns. In total, the park received more visitors in each successive year.

Summer visitor numbers rose from 210,000 in 2021 to a peak of 260,000 in 2022, before falling slightly to 245,000 in the final year. Autumn, which was the second busiest season in all three years, saw a small drop from 120,000 to 115,000, followed by significant rise to 150,000 in 2023.

Spring showed the most consistent growth. The number of visitors increased from 85,000 to 110,000 and then to 140,000, meaning that spring had almost caught up with autumn by the end of the period. Although winter remained the quietest season, visitor numbers more than doubled over the three years, climbing from 30,000 to 45,000 and eventually reaching 70,000.

Band 8

193 words

Key features skilfully selected with a clear overview · figures used selectively, including accurate derived growth · cohesion managed skilfully · wide, precise vocabulary · varied, error-free structures.

The chart illustrates seasonal visitor numbers at a national park over three consecutive years, from 2021 to 2023.

Summer was the park's peak season throughout, and winter the quietest. Overall, however, the park became busier over the period, with the most sustained growth occurring in spring and winter, the two seasons that increased year on year.

Summer attracted the largest numbers by a wide margin, rising from 210,000 visitors in 2021 to 260,000 the following year, before easing slightly to 245,000 in 2023; this was the only season to record a fall in the final year. Autumn followed an almost opposite pattern: after a marginal dip from 120,000 to 115,000, it rose sharply to 150,000, its highest level in the period.

Spring, meanwhile, grew steadily from 85,000 to 110,000 and then 140,000, an overall increase of 55,000 that brought it within striking distance of the autumn figure. Although winter remained by far the least popular season, it showed the strongest relative growth, with visitor numbers more than doubling from 30,000 to 70,000 over the two years, via 45,000 in 2022.

Daily unpaid household work by sex

id wb1_bar_15

The bar chart below shows the average time men and women in five countries spent on unpaid household work each day.

Band 6

175 words

Figures accurate with some comparison · overview present but only at the end · mechanical linking · limited vocabulary · preposition, agreement, tense and punctuation errors that do not impede meaning.

The bar chart shows how many minutes men and women in five countries spent for unpaid housework each day.

In all five countries women spent more time than men. The biggest difference is in Country X, where women did housework for 290 minutes but men only did 45 minutes. In Country V, women spent 240 minutes and men spent 80 minutes, so women spent three times more than men.

In Country W and Country Z, men did more housework than in the other countries. Men in Country Z spent 170 minutes, which was the highest for men, and women spent 245 minutes. In Country W, the figures was 150 minutes for men and 225 minutes for women, so the difference was not very big.

Country Y had the smallest gap between men and women. Women spent 170 minutes, it was the lowest figure for women, and men spent 110 minutes.

Overall, women do much more unpaid housework than men in every countries, but the difference between men and women is not same in each country.

Band 7

199 words

Clear overview of the gender gap and its variation · key features highlighted with accurate comparisons · logical grouping · good range of linkers and vocabulary · one minor agreement slip.

The chart compares the average amount of time that men and women in five countries spent each day on unpaid household work.

Overall, women spent more time on household tasks than men in every country, although the size of the gap varied considerably. It was widest in Country X and narrowest in Country Y.

The difference was most pronounced in Country X, where women did 290 minutes of unpaid work per day, the highest figure on the chart, while men contributed only 45 minutes, the lowest. A similar, though less extreme, pattern was found in Country V, with women spending 240 minutes on housework, three times as much as men (80 minutes).

In the remaining three countries, men took a greater share of household work. Men in Country Z spent 170 minutes a day on these tasks, more than in any other country, compared to 245 minutes for women. The figures for Country W was similar, at 150 and 225 minutes respectively, a gap of 75 minutes in both cases. In Country Y, women spent 170 minutes a day on housework, the least of all the countries, and men 110 minutes, leaving a difference of just 60 minutes.

Band 8

194 words

Key features skilfully selected with accurate derived ratios · clear overview · logical grouping from largest to smallest gap · cohesion managed well · precise vocabulary · wide range of structures, error-free.

The bar chart compares the average daily time spent on unpaid domestic work by men and women in five countries.

Women consistently undertook more unpaid household work than men, but the extent of the imbalance differed markedly between countries. It was greatest in Country X and smallest in Country Y, while men's contribution was highest in Countries Z and W.

In Country X, women devoted 290 minutes a day to domestic tasks, almost five hours and the highest figure shown, whereas men spent just 45 minutes, meaning that women did more than six times as much. Country V displayed a similar, if less pronounced, imbalance: women's 240 minutes were exactly three times the 80 minutes recorded for men.

The division of labour was considerably more even elsewhere. Men in Country Z spent 170 minutes on household work, the most for any male group, and those in Country W 150 minutes; women in these countries spent 245 and 225 minutes respectively, a gap of 75 minutes in each case. Country Y had the narrowest difference, just 60 minutes, as women there spent the least time of any female group (170 minutes) and men 110 minutes.

Life expectancy at birth, 2022

id wb1_bar_16

The chart below shows life expectancy at birth for men and women in six countries in 2022.

Band 6

166 words

Figures accurate and the key Russia/Egypt contrast noted · basic overview at the end · simple linking · some informal and imprecise wording · agreement, word-form and noun-modifier errors that do not block meaning.

The chart shows the life expectancy at birth of men and women in six countries in 2022.

In every country, women live longer than men. Japan has the highest life expectancy, women 87.1 years and men 81.1 years. Spain is second with 85.9 years for women and 80.4 years for men. Chile is also quite high, 82.1 for women and 77.2 for men.

Russia is interesting because the difference between men and women is very big. Women can live 77.8 years but men only 67.0 years, so the gap is almost 11 years. In Egypt, men life expectancy is 69.5 years, which is higher than Russian men, but women is 74.1 years, which is lower than Russian women.

Kenya has the lowest life expectancy for both sex. Men is 60.2 years and women is 65.4 years, so they are much lower than the other countries.

Overall, women have longer life expectancy than men in all countries, and Japan is the highest while Kenya is the lowest.

Band 7

181 words

Clear overview of the gender gap, highest and lowest · key features highlighted with apt comparisons · good cohesion · some less common vocabulary · mostly accurate grammar with one apostrophe slip.

The bar chart compares male and female life expectancy at birth in six countries in 2022.

Overall, women were expected to live longer than men in all six countries. Japan had the highest life expectancy for both sexes, whereas Kenya had the lowest, and the gap between men and women was noticeably wider in Russia than elsewhere.

Japan topped the chart, with a life expectancy of 87.1 years for women and 81.1 years for men, closely followed by Spain, where the figures were 85.9 and 80.4 years. Chile came next, with women expected to live to 82.1 and men to 77.2 years.

Russia stood out because of its large gender gap of almost 11 years: Russian women could expect to live 77.8 years, while men could only expect 67.0 years. Interestingly, Russian men had a lower life expectancy than Egyptian men (69.5 years), even though Russian women outlived their Egyptian counterparts, whose figure was 74.1 years. Kenya recorded the lowest figures of all, with 65.4 years for women and just 60.2 years for men, around 21 years less than Japanese men.

Band 8 203 words

Key features skilfully selected, including an insightful cross-country contrast · clear overview · accurate derived gaps · cohesion managed well · precise, varied vocabulary · complex sentences handled without error.

The chart shows the life expectancy at birth of men and women in six countries in 2022.

In all six countries, women could expect to outlive men, typically by five years or so. Life expectancy was highest in Japan and lowest in Kenya for both sexes, while Russia was unusual in having a gender gap roughly twice as large as those elsewhere.

Japan and Spain had the highest figures, with Japanese women expected to live to 87.1 and men to 81.1, and the equivalent Spanish figures only slightly lower, at 85.9 and 80.4. Chile followed, at 82.1 years for women and 77.2 for men. At the other end of the scale, Kenyan men had a life expectancy of just 60.2 years, more than 20 years below that of Japanese men, and Kenyan women 65.4.

The most striking feature, however, was the disparity in Russia. There, women could expect to reach 77.8 years, but men only 67.0, a difference of 10.8 years. In fact, Russian men had a lower life expectancy than men in Egypt (69.5), even though Russian women lived considerably longer than Egyptian women, whose figure was 74.1. Egypt, in turn, had the smallest gender gap on the chart, at 4.6 years.

Recorded music revenue by format

id wb1_bar_17

The chart below shows global revenue from recorded music by format in 2010, 2015, 2020 and 2025.

Band 6

170 words

Main trends identified and figures accurate · overview short and placed last · format-by-format listing with basic linking · some imprecise word choice · agreement and verb-form errors that do not impede meaning.

The chart shows the global revenue from recorded music in four formats, which are CD, vinyl, downloads and streaming, in 2010, 2015, 2020 and 2025.

In 2010, CD was the most popular format with \$8.4 billion. Downloads was second with \$4.2 billion, but streaming and vinyl was very small, only \$0.4 billion and \$0.2 billion.

After that, CD revenue fell a lot. It went down to \$4.6 billion in 2015, \$1.8 billion in 2020 and only \$1.1 billion in 2025. Downloads also decreased, from \$4.2 billion to \$3.9 billion in 2015, and then it dropped to \$0.5 billion in 2025.

On the other hand, streaming increased very fast. In 2015 it was \$2.9 billion but in 2020 it jumped to \$13.4 billion, and in 2025 it reached to \$20.8 billion, which is the highest figure in the chart. Vinyl also grow, from \$0.2 billion to \$2.1 billion, so in 2025 it was more than CD.

Overall, streaming became the main format for music, while CD and downloads became less important.

Band 7

192 words

Clear overview of the shift to streaming · key trends well highlighted with accurate figures · logical progression and a range of linkers · some less common vocabulary · one minor verb-form slip.

The bar chart illustrates worldwide revenue from recorded music in four different formats at five-year intervals between 2010 and 2025.

Overall, there was a dramatic shift from physical and downloaded music towards streaming, which grew to dominate the market. Revenue from CDs and downloads declined significantly, whereas vinyl saw steady growth.

In 2010, CDs generated the largest income, at \$8.4 billion, twice as much as downloads (\$4.2 billion), while streaming and vinyl brought in less than half a billion dollars each. Over the following fifteen years, CD revenue fell continuously, dropping to \$4.6 billion in 2015 and to only \$1.1 billion by 2025. Downloads followed a similar downward path, although the decline was slow at first, from \$4.2 billion to \$3.9 billion, before accelerating to reach just \$0.5 billion in 2025.

Streaming, by contrast, grew enormously. From a mere \$0.4 billion in 2010, it rose to \$2.9 billion in 2015 and then jumped to \$13.4 billion in 2020, making it the leading format. By 2025 it had reached \$20.8 billion. Vinyl sales also increased steadily over the period, climbing from \$0.2 billion to \$2.1 billion and overtook CDs in the final year.

Band 8

191 words

Key features skilfully selected with accurate derived multiples · clear, well-placed overview · contrasting trends linked fluently · wide, precise vocabulary · wide range of structures, error-free.

The chart tracks global revenue from four recorded music formats, CD, vinyl, downloads and streaming, at five-yearly intervals from 2010 to 2025.

The period was marked by the spectacular rise of streaming, which went from a negligible source of income to overwhelmingly the largest. Revenue from CDs and downloads contracted sharply, while vinyl, despite remaining a relatively small format, enjoyed sustained growth.

In 2010, CDs were the principal source of revenue, earning \$8.4 billion, double the figure for downloads (\$4.2 billion). Both formats subsequently declined, though at different rates: CD income fell steadily to \$1.1 billion by 2025, whereas downloads held up reasonably well until 2015, at \$3.9 billion, before collapsing to \$1.2 billion in 2020 and a mere \$0.5 billion in 2025.

Streaming revenue, meanwhile, rose from just \$0.4 billion in 2010 to \$2.9 billion in 2015, and then surged to \$13.4 billion in 2020, exceeding all the other formats combined. By 2025 it had reached \$20.8 billion, more than fifty times its initial level. Vinyl followed a more modest but equally consistent upward trend, increasing more than tenfold from \$0.2 billion to \$2.1 billion and eventually outperforming CDs.

Teenage ownership of digital devices, 2012 and 2024

id wb1_bar_18

The bar chart below shows the percentage of teenagers in one country who owned five types of digital device in 2012 and 2024.

Band 6

165 words

Figures accurate with one useful calculation · simple overview at the end · mechanical linking and listing · repetitive vocabulary · article, relative-pronoun, verb-form and punctuation errors that do not block meaning.

The bar chart shows the percentage of teenagers in one country which owned five kinds of digital devices in 2012 and 2024.

In 2012, games console was the most popular device, 70% of teenagers had one. Laptop was 52% and smartphone was 45%, so smartphone was only in the third place. Only 18% of teenagers owned a tablet and nobody had a smartwatch.

In 2024, the smartphone became the most popular device and it increased to 96%, so nearly all teenagers had one. The smartphone had the biggest increase of 51 percentage points. Laptop also rose to 71% and tablet increase from 18% to 44%. Smartwatch was 0% in 2012 but in 2024 it was 29%. The only device which went down was games console, it fell from 70% to 62%.

Overall, most of devices became more common between 2012 and 2024, especially the smartphone. However, the games console was less popular in 2024 than in 2012, although it was still owned by many teenagers.

Band 7

177 words

Clear overview identifying the change in the leading device · key features highlighted and grouped logically · good cohesion · some less common vocabulary · one minor agreement slip.

The bar chart compares the proportion of 13 to 17-year-olds in a particular country who owned five different digital devices in 2012 and 2024.

Overall, ownership of most devices increased significantly over the period, with smartphones replacing games consoles as the most commonly owned device. Games consoles were the only device to become less common.

In 2012, games consoles were the most widely owned device among teenagers, at 70%, followed by laptops (52%) and smartphones (45%). By 2024, however, smartphone ownership had more than doubled to 96%, meaning that almost every teenagers had one. Laptop ownership also rose, but more gradually, reaching 71%, whereas the proportion owning a games console fell slightly to 62%. As a result, games consoles dropped to third position, behind both smartphones and laptops.

The two remaining devices were much less common, although both saw considerable growth. The percentage of teenagers with a tablet increased from 18% to 44%, more than doubling, while smartwatches, which were not owned by any teenagers in 2012, had been acquired by 29% of them by 2024.

Band 8

181 words

Key features skilfully selected around the rise of smartphones · clear overview · accurate figures and derived changes · cohesion managed well · precise, natural vocabulary · varied, error-free structures.

The chart compares the percentage of teenagers aged 13 to 17 in one country who owned each of five digital devices in 2012 and 2024.

The most significant development was the rapid spread of smartphones, which went from being owned by fewer than half of teenagers to near-universal ownership, displacing games consoles as the most common device. Ownership of every other device also grew, with the sole exception of games consoles.

In 2012, games consoles led the way, owned by 70% of teenagers, ahead of laptops at 52% and smartphones at 45%. Twelve years later, smartphone ownership had surged by 51 percentage points to 96%, while laptops saw a more moderate rise to 71%. Games consoles, by contrast, became slightly less widespread, with ownership slipping to 62%, though they remained the third most common device.

Tablets and smartwatches were owned by comparatively few teenagers but recorded notable gains. The proportion with a tablet more than doubled, from under a fifth (18%) to 44%, while smartwatches, which none of the teenagers owned in 2012, had been taken up by 29% by 2024.

Airport passenger numbers, 2019 and 2023

id wb1_bar_19

The chart below shows the number of passengers who used six international airports in 2019 and 2023.

Band 6

181 words

Figures accurate and key changes noted · overview present but basic and placed last · linking adequate but mechanical · some repetition · agreement, tense, quantifier and punctuation errors that do not block meaning.

The chart shows how many passengers used six international airports in 2019 and in 2023.

Airport A was the busiest airport in both years. It had 86 million passengers in 2019, but in 2023 it decreased to 79 million. Airport B was second, and it increased from 71 million to 76 million, so the difference between A and B became smaller.

Airport C had 64 million passengers in 2019, but it fell to 51 million in 2023, which is the biggest decrease in the chart. Because of this, Airport D which increased from 48 million to 52 million was a little higher than Airport C in 2023.

The two smaller airports were different. Airport E went down from 35 million to 25 million, however Airport F went up from 22 million to 29 million. So Airport F was still the smallest but it was closer to Airport E than before.

Overall, three airports had less passengers in 2023 than in 2019 and three airports had more. Airport A was the busiest and Airport F was the least busy in both years.

Band 7

181 words

Clear overview of rises and falls · key features highlighted, including changes in ranking · logical organisation with good cohesive devices · appropriate vocabulary · mostly accurate with one agreement slip.

The bar chart compares passenger numbers at six international airports in 2019 and 2023.

Overall, half of the airports handled fewer passengers in 2023 than in 2019, while the other half saw an increase. Airport A remained the busiest airport throughout, and Airport F the least busy.

Airport A served 86 million passengers in 2019, but this figure fell to 79 million in 2023. Meanwhile, Airport B grew from 71 million to 76 million, which reduced the gap between the two largest airports from 15 million to only 3 million. Airport C experienced the sharpest drop, losing 13 million passengers to finish at 51 million, and as a result it was narrowly overtaken by Airport D, whose passenger numbers rose modestly from 48 million to 52 million.

Among the smaller airports, the trends were opposite. Airport E saw its passengers fall from 35 million to 25 million, whereas Airport F recorded the largest increase of any airport, going up by 7 million to 29 million. Consequently, the difference between these two airports were much smaller in 2023, at just 4 million.

Band 8

185 words

Key features skilfully selected, including narrowing gaps and ranking changes · clear overview · accurate derived comparisons · cohesion managed well · precise vocabulary · varied, error-free structures.

The chart compares the number of passengers passing through six international airports in 2019 and 2023.

The six airports were split evenly between those that gained and those that lost passengers over the period. Although Airport A retained its position as the busiest and Airport F remained the quietest, the gaps between several airports narrowed noticeably.

Airport A handled 86 million passengers in 2019, 15 million more than Airport B. By 2023, however, its total had slipped to 79 million, whereas Airport B had grown to 76 million, leaving the two almost level. Airport C suffered the steepest decline of all, from 64 million to 51 million, and was consequently overtaken, albeit narrowly, by Airport D, which rose from 48 million to 52 million.

A similar contrast can be seen between the two smallest airports. Passenger numbers at Airport E fell by more than a quarter, from 35 million to 25 million, whereas Airport F grew by almost a third, from 22 million to 29 million, the largest increase recorded. As a result, Airport F ended the period only 4 million passengers behind Airport E.

Food spending by income group, 2024

id wb1_bar_20

The chart below shows how households in three income groups in one country divided their food spending in 2024.

Band 6

171 words

All figures accurate · overview present but late · group-by-group listing with repetitive structures · limited vocabulary · recurring agreement errors plus article and word-choice slips that do not block meaning.

The chart shows how the households in three income groups spend their money on food in one country in 2024.

Low income households spend most of their food money on groceries, which is 72%. Takeaway is 14%, restaurants is only 8% and work or school meals is 6%.

For middle income households, groceries is also the biggest part but it is lower, 58%. Restaurants is 18%, takeaway is 16% and work or school meals is 8%. This group spends a bit more on takeaway than the others.

High income households are different from the other groups. Groceries is only 41%, and restaurants is 32%, which is four times more than low income group. Takeaway is 15% and work or school meals is 12%, and this is the highest for this category.

Overall, groceries is the biggest part of food spending for all groups, but when the income is higher, people spend less percentage on groceries and more on restaurants. Takeaway is almost same for all three groups, between 14% and 16%.

Band 7

187 words

Clear overview of how spending shifts with income · key features highlighted with accurate comparisons · logical progression and varied linking · good collocations · one or two minor slips.

The bar chart compares how households in three different income groups divided their spending on food between groceries, restaurants, takeaways and work or school meals in 2024.

Overall, groceries accounted for the largest share of food spending in all three groups, but this share decreased as income rose. In contrast, the proportion spent on eating in restaurants increased considerably with income, while spending on takeaway food was relatively similar across the groups.

Low-income households spent almost three-quarters of their food budget (72%) on groceries, compared with 58% for middle-income families and just 41% for the wealthiest group. The opposite pattern was seen for restaurant meals, which made up only 8% of spending for low-income households, but 18% for those in the middle group and 32% for high-income households, four times as much as the lowest group.

Takeaway food represented a fairly stable share, ranging from 14% to 16%, with the middle-income group spending slightly more than others. Meanwhile, work and school meals accounted for the smallest proportions, although the figure rose steadily from 6% among low earners to 8% and then 12% in the highest income bracket.

Band 8

195 words

Key features skilfully selected around the income gradient · clear overview · accurate figures and derived ratios · sophisticated cohesion · wide, precise vocabulary · complex structures used accurately throughout.

The chart illustrates how food expenditure was distributed across four categories by low-, middle- and high-income households in one country in 2024.

Groceries were the largest component of food spending for every group, but their share fell markedly as income increased. Conversely, the more households earned, the greater the proportion they devoted to restaurant meals and, to a lesser extent, work or school meals, while takeaway spending varied little.

For low-income households, groceries absorbed 72% of the food budget, leaving relatively little for other categories: 14% went on takeaways, 8% on restaurants and 6% on work or school meals. Middle-income households spent a smaller share on groceries (58%) and more than twice as much, proportionally, on restaurants (18%), with takeaways and work or school meals at 16% and 8%.

The contrast was sharpest in the high-income group. Here, groceries accounted for only 41% of food spending, while restaurants made up 32%, four times the share recorded for low-income households. Work or school meals also reached their highest level, at 12%, double the proportion for the lowest income group. Takeaways, by contrast, remained remarkably consistent, representing between 14% and 16% of spending in all three groups.

Household energy use, 1990

id wb1_pie_01

The pie charts below show how energy was used in an average household in one country in 1990 and 2020.

Household energy use, 1990

■ Space heating ■ Lighting
■ Water heating ■ Appliances
■ Cooking

Household energy use, 2020

■ Space heating ■ Lighting
■ Water heating ■ Appliances
■ Cooking

Band 6

170 words

Covers all categories with accurate figures · overview is basic and placed at the end · mechanical linking (Also, However) · adequate vocabulary · several agreement, article and tense errors.

The pie charts illustrates the proportion of energy which was used for different purposes in a typical home in one country in 1990 and in 2020.

In 1990, space heating was the biggest use of energy, it made up 58% of the total. Water heating was in second place with 22%. The other three categories was quite small, cooking was 7%, appliances accounted for 8% and lighting only 5%.

In 2020, space heating was still the largest part but it decreased to 44%. Also, water heating dropped to 18%. Cooking and lighting also went down a little, to 6% and 3% respectively. However, the appliances had a big increase, from 8% to 29%, so this became the second biggest category in 2020 and it was more than water heating. This was the only use of energy that increased in the period.

Overall, heating the space used the most of energy in both years, but the share of appliances grow a lot and all the other uses become smaller than before.

Band 7

178 words

Clear overview of main trends · key changes well highlighted with accurate figures · logical progression with a range of linkers · some less common vocabulary · mostly error-free sentences.

The two pie charts compare the ways in which energy was consumed in an average household in a particular country in 1990 and 2020.

Overall, space heating remained the main use of household energy in both years, although its share declined noticeably. The most striking change was the dramatic rise in the proportion used by appliances, while every other category fell slightly.

In 1990, more than half of domestic energy (58%) went on heating rooms, and water heating accounted for a further 22%. By contrast, appliances, cooking and lighting each represented less than a tenth of the total, at 8%, 7% and 5% respectively, so together they made up only a fifth of consumption.

Thirty years later, the figure for space heating had dropped to 44%, and water heating had also decreased, to 18%. Cooking and lighting saw only marginal falls, to 6% and 3%. Appliances, on the other hand, grew from 8% to 29%, which means their share more than tripled and they overtook water heating to become the second largest use of energy in the home.

Band 8

180 words

Key features skilfully selected · clear, well-placed overview · figures used selectively for comparison · cohesion managed smoothly · precise vocabulary (absorbed, contracted, edged down) · wide range of error-free structures.

The pie charts show how energy consumption in a typical home in one country was divided between five uses in 1990 and 2020.

It is clear that heating living space consumed the largest share of household energy in both years, although its dominance weakened over the period. Meanwhile, appliances rose from a minor category to the second largest, at the expense of every other use.

In 1990, space heating alone absorbed 58% of the energy used in the home, and together with water heating (22%) it accounted for four-fifths of the total. The remaining three uses were comparatively insignificant: appliances took 8%, cooking 7% and lighting a mere 5%.

By 2020, this pattern had shifted considerably. The share devoted to space heating had contracted to 44%, and water heating had slipped to 18%, so the two combined now made up just 62%. Cooking and lighting also edged down, to 6% and 3% respectively. In sharp contrast, the proportion consumed by appliances more than tripled to 29%, overtaking water heating and becoming the only category to expand over the thirty-year period.

University income, 2005

id wb1_pie_02

The charts below show the main sources of income for a university in 2005 and 2025.

Band 6

176 words

Relevant figures reported accurately · overview present but simple and placed last · repetitive linking and vocabulary (went up, decreased) · several agreement and article errors that do not obscure meaning.

The charts shows the main sources of money that a university received in 2005 and 2025.

In 2005 the biggest source of income was government grants, which was 48%. Tuition fees was the second with 27% and research contracts gave 15%. Donations and other sources were very small, only 4% and 6%. So, the government and the students paid for most of the university in that year.

In 2025 the situation was quite different. Tuition fees became the largest source and it increased to 49%, almost the half of all income. On the other hand, government grants decreased very much to 21%. Research contracts had a small rise to 18%. Also donations went up to 5% and other sources went up to 7%, but they were still the smallest. It means that the students paid much more than the government in 2025.

Overall, the university depended on the government in 2005, but in 2025 it get most of its money from the students fees. The other sources did not change a lot during the twenty years.

Band 7

178 words

Clear overview identifying the key reversal · main features highlighted and compared · logical paragraphing with varied linkers · good collocations (principal source, rose modestly) · frequent error-free sentences.

The pie charts illustrate where a university obtained its income from in 2005 and 2025.

Overall, the most significant change was that tuition fees replaced government grants as the university's principal source of funding. The remaining three sources made up a relatively small share of income in both years and rose only slightly.

In 2005, government grants provided almost half of the university's income, at 48%, while tuition fees contributed just over a quarter (27%). Research contracts accounted for 15%, and donations and other sources made up the rest, with 4% and 6% respectively.

By 2025, this situation had been reversed. Tuition fees had risen by 22 percentage points to 49%, making them the dominant source of money. In contrast, the proportion coming from government grants fell sharply to 21%, which was less than half of its previous level. As a result, the university became far more reliant on the money paid by its students. Research contracts increased modestly to 18%, and there were marginal rises in donations and other income, which reached 5% and 7% respectively.

Band 8

190 words

Well-selected key features with a skilfully framed overview · accurate, purposeful comparisons (fall of 27 points) · seamless cohesion · precise, natural vocabulary · wide range of structures with no errors.

The two charts compare the proportions of a university's income that came from five different sources in 2005 and 2025.

The most notable development over the twenty years was a reversal in the roles of government funding and student fees: the university shifted from relying chiefly on the state to depending on tuition payments. The three smaller sources, meanwhile, remained broadly stable.

In 2005, government grants were the institution's main source of revenue, supplying 48% of the total, whereas tuition fees contributed 27%. Research contracts made up a further 15%, leaving donations (4%) and miscellaneous income (6%) with only a marginal role.

By 2025, the balance had tipped decisively towards fees. Their share had climbed to 49%, while government grants had shrunk to 21%, a fall of 27 percentage points and considerably less than half their earlier level. In other words, the positions of the two main sources had almost exactly swapped. Research contracts grew modestly to 18%, and donations and other income each edged up by a single point, to 5% and 7% respectively, so these three categories together still generated less than a third of the university's income.

Men

id wb1_pie_03

The pie charts below show the main reasons why male and female employees left their jobs at a large company in 2024.

**Band 6**

166 words

Accurate coverage of both charts · overview placed at the end and fairly general · mechanical sequencing (Firstly, Also) · some repetition · several verb form, agreement and comparative errors that do not impede meaning.

The pie charts give information about why male and female workers left their job in a big company in 2024.

Firstly, for men the most common reason was better salary in another place, with 38%. Career progression was the second reason at 24%. Work-life balance was 12% and relocation and retirement was both 10%. Only 6% of men leaved because of family reasons. So for men, salary and career was clearly more important than the other reasons.

For women, the picture is different. The biggest reason was work-life balance with 23%, and better salary was nearly the same at 22%. Also family reasons was very important for women, it was 21%, which is much more higher than for men. Career progression was 19%, relocation 9% and retirement only 6%.

Overall, men mostly left their jobs because of money and career, but women had more different reasons and the family and work-life balance were more important to them than to men. Relocation was similar for both genders.

Band 7

177 words

Clear overview contrasting the two groups · key differences highlighted and supported with figures · logical organisation by gender · good range of linking and comparison language · few errors.

The two pie charts compare the main reasons given by men and women for leaving their jobs at a large company in 2024.

Overall, male employees were mainly motivated by financial and career considerations, whereas female employees' reasons were spread more evenly, with work-life balance and family matters playing a much larger role.

Among men, the single most common reason was a better salary elsewhere, cited by 38%, followed by career progression at 24%. Together, these two factors accounted for almost two-thirds of male departures. Work-life balance was mentioned by 12% of men, while relocation and retirement each represented 10%. Family reasons were the least significant, at only 6%.

For women, by contrast, no single reason dominated. Work-life balance was the top reason (23%), closely followed by a better salary (22%) and family reasons (21%), the latter being more than three times the figure for men. Career progression was slightly less important, at 19%. Relocation had a similar share for both sexes (9% for women), and retirement was the least frequent reason for female employees, at 6%.

Band 8

202 words

Skilful selection of the key contrasts · clear overview · figures used selectively for comparison (gap of 16 points, three times) · smooth cohesion · precise, natural vocabulary · wide range of accurate structures.

The charts break down the reasons why male and female staff resigned from a large company in 2024.

The most striking contrast is that men left overwhelmingly for pay and promotion, while women's departures were distributed far more evenly across several motives, among which work-life balance and family commitments featured prominently.

For male employees, a better salary elsewhere was by far the leading factor, at 38%, and career progression accounted for a further 24%, meaning that these two reasons together explained 62% of resignations. Work-life balance lagged well behind at 12%, and relocation and retirement were each responsible for 10%, while family reasons were the least cited, at just 6%.

Among female employees, the pattern was much flatter. Work-life balance ranked first with 23%, but it was only marginally ahead of better pay (22%) and family reasons (21%), and career progression was not far behind at 19%. The gender gap was widest for family reasons, which were more than three times as common among women as among men, and for salary, where the male figure was 16 points higher. By contrast, relocation was almost identical for the two groups, at 10% and 9%, and retirement was less common among women (6%).

Travel to campus, 2000

id wb1_pie_04

The charts below show how students at a college travelled to campus in 2000 and 2020.

**Band 6**

171 words

Main changes identified with accurate figures · overview only in the final paragraph · simple, repetitive linking · adequate vocabulary with some imprecision (number/percentage) · several article and agreement errors.

The pie charts shows how the students of a college went to the campus in 2000 and 2020.

In 2000, car was the most popular way to travel, with 46% of students. Bus was second with 30%. Walking was 12%, bicycle was 8% and train was the lowest with only 4%. So most of students used a car or a bus at that time.

In 2020, there were many changes. The number of students who used car fell down to 21%, which is less than the half of 2000. Bus stayed nearly same at 28% and it became the most popular way. On the other hand, the bicycle increased very much from 8% to 25%. Walking also increased a little to 15% and train went up to 11%.

To sum up, the car was the main transport in 2000 but in 2020 students used more bus and bicycle. Using the train and walking also became more popular, so the students used more different ways to get to the college than before.

Band 7

178 words

Clear overview of the main shifts · key features well selected and supported with accurate figures · logical progression · varied cohesive devices · good vocabulary with few errors.

The pie charts illustrate the modes of transport that students at a college used to get to campus in 2000 and 2020.

Overall, the car lost its position as the dominant form of transport over the twenty-year period, while cycling became far more popular. By 2020, the bus was the most common way of travelling to college.

In 2000, almost half of all students (46%) drove to campus, and a further 30% took the bus. Only a small minority walked (12%) or cycled (8%), and the train was the least popular option, used by just 4% of students.

Twenty years later, the proportion of students travelling by car had fallen by more than half, to 21%. The bus remained relatively stable at 28%, which meant that it overtook the car as the most frequently used mode. The most dramatic change was in cycling, which rose from 8% to 25%, more than tripling. The figures for walking and the train also increased, to 15% and 11% respectively, indicating that students were using a wider range of transport than before.

Band 8

192 words

Key features skilfully selected with a well-placed overview · accurate, comparative use of figures (more than tripled, almost trebling) · cohesion well managed · precise vocabulary · wide range of error-free structures.

The two charts compare the ways in which students at a college travelled to campus in 2000 and 2020.

The overriding trend is a marked shift away from the car towards more sustainable modes of transport, particularly cycling. As a result, students' choices were considerably more balanced in 2020 than they had been two decades earlier.

In 2000, the car was clearly the preferred option, accounting for 46% of journeys, and when combined with the bus (30%) it covered more than three-quarters of all trips to campus. Walking and cycling were relatively uncommon, at 12% and 8% respectively, and only 4% of students commuted by train.

By 2020, reliance on the car had diminished substantially, with its share falling to 21%, so that the bus, despite a slight dip to 28%, became the leading mode. The most remarkable growth occurred in cycling, which more than tripled to 25% and thus overtook both walking and the car. Rail travel also gained ground, almost trebling from 4% to 11%, while walking increased modestly to 15%. Consequently, no single mode of transport accounted for even a third of journeys by the end of the period.

Country A, 2020

id wb1_pie_05

The pie charts below show the age structure of the populations of two countries in 2020.

Band 6

161 words

Relevant comparison with accurate figures · overview present but late and repetitive · mechanical organisation and linking · limited range of vocabulary · several agreement and article errors which do not block meaning.

The pie charts compares the age groups of the population in two countries, Country A and Country B, in 2020.

In Country A, children aged 0 to 14 were the biggest group with 41%. People from 15 to 29 was 28% and 30 to 44 was 16%. The older groups were small, 45 to 64 was 11% and the people over 65 was only 4%.

Country B was very different. The biggest group was 45 to 64 years with 28% and the over 65 was 24%, which is much higher than in Country A. The group of 30 to 44 had 19%, and 15 to 29 had 16%. The children was the smallest group with only 13%.

Overall, it is clear that Country A has a very young population because most of people are young, but Country B has an older population. In Country A the percentage go down when the age go up, but in Country B it is opposite.

Band 7

199 words

Clear overview of the contrasting patterns · key features highlighted with accurate figures and a valid comparison · clear paragraphing · range of linkers with slight over-use of sequencing · few minor errors.

The pie charts compare the age profiles of the populations of Country A and Country B in 2020.

Overall, Country A had a very young population, with the proportion of people in each age group declining steadily as age increased. Country B, on the other hand, had a much older population, with its largest share in the 45–64 bracket.

In Country A, children aged 0–14 made up the largest group, at 41%, and people aged 15–29 accounted for a further 28%. This means that more than two-thirds of the population were under 30. The share then fell to 16% for those aged 30–44 and 11% for the 45–64 group, while only 4% of people were aged 65 or over.

The situation in Country B was almost the reverse. The 45–64 age group was the largest, at 28%, followed closely by the over-65s, who represented nearly a quarter of the population (24%). The middle age group, 30–44, made up 19%, whereas young people aged 15–29 and children accounted for just 16% and 13% respectively. Therefore, the proportion of elderly people in Country B was six times higher than in Country A.

Band 8

203 words

Key features skilfully selected and compared · clear overview framing the contrast · accurate derived comparisons · cohesion managed naturally · precise vocabulary (tapered, weighted towards) · wide, accurate range of structures.

The charts illustrate how the populations of two countries were distributed across five age groups in 2020.

The two countries display almost opposite demographic profiles: Country A's population was heavily weighted towards the young, whereas Country B's was concentrated in the older age brackets.

In Country A, the proportion of the population fell consistently with each successive age group. Children under 15 constituted the largest segment, at 41%, and when the 15–29 group (28%) is added, it becomes clear that over two-thirds of the population were under 30. The share then tapered to 16% for those aged 30–44 and 11% for the 45–64 age group, and people aged 65 and over made up a mere 4%.

Country B, by contrast, had a markedly older population. The largest group was aged 45–64, at 28%, and the over-65s accounted for almost a quarter (24%), a proportion six times higher than in Country A. Those aged 30–44 represented 19%, while the younger groups were comparatively small: 16% were aged 15–29 and only 13% were children, less than a third of the equivalent figure for Country A. In other words, more than half of Country B's population was 45 or older.

Transport Other

Household spending, 2020

Food Clothing
Housing Leisure
Transport Other

Band 6

166 words

Accurate figures for every category · simple overview at the end · repetitive linking and verbs (increased, decreased) · adequate vocabulary · several agreement, tense and preposition errors that do not affect understanding.

The two pie charts show the percentage of money that households in one country spent on different things in 1980 and in 2020.

In 1980, food was the biggest part of spending with 31%. Housing was 19% and other items was 17%. Transport took 13%, clothing 11% and leisure was the smallest with 9%. So food and housing was together half of the spending in that year.

In 2020, there was some big changes. Housing became the largest expense, it rose to 33%. On the other hand, the spending on food went down to 14%, which is less than half of 1980. Leisure also increased and it was 18%, so it doubled. Transport went up a little to 15%. However, clothing decreased from 11% to 5% and other items decreased slightly to 15%.

Overall, in 1980 people spend most of their money on food, but in 2020 housing was the most important. Also people spent more money for leisure and less money for clothes than before.

Band 7

178 words

Clear overview identifying the main shifts · key features highlighted with accurate figures · logical structure · good range of cohesive devices and collocations (allocated to, share devoted to) · mostly error-free.

The pie charts compare how households in one country divided their spending between six categories in 1980 and 2020.

Overall, the proportion of household budgets spent on housing and leisure increased significantly over the forty years, while the share allocated to food and clothing fell. As a result, housing replaced food as the largest area of expenditure.

In 1980, food accounted for almost a third of household spending (31%), making it the biggest single item. Housing came second at 19%, followed by other items at 17%. Transport, clothing and leisure represented smaller shares, at 13%, 11% and 9% respectively.

By 2020, the picture had changed considerably. Spending on housing had risen to 33%, while the share devoted to food had more than halved, dropping to 14%. Leisure also saw a notable increase, doubling to 18%. In contrast, households spent a smaller proportion on clothing, which fell from 11% to 5%. The remaining categories changed only slightly, with transport rising to 15% and other items decreasing to 15%, so these two categories had exactly the same share in 2020.

Band 8

190 words

Key features skilfully selected and grouped · clear, well-placed overview · precise comparative figures (14 points, doubled) · smooth cohesion · sophisticated vocabulary used naturally · wide range of accurate structures.

The charts illustrate the proportion of household expenditure that went on six categories of goods and services in one country in 1980 and 2020.

The most significant development was a reversal in the relative importance of food and housing: food was the largest expense in 1980, whereas housing had become dominant by 2020. Leisure also gained ground considerably, while clothing became a relatively minor item.

In 1980, food consumed 31% of household budgets, well ahead of housing, which accounted for 19%. Miscellaneous items made up 17%, and the remaining spending was split fairly evenly between transport (13%), clothing (11%) and leisure (9%).

Four decades later, housing costs absorbed a third of all spending (33%), an increase of 14 percentage points, while the share devoted to food had fallen to 14%, less than half its earlier level. Leisure spending doubled to 18%, overtaking both transport and other items, whereas clothing shrank from 11% to just 5%. Transport and other items, by contrast, remained broadly stable, at 15% each, which suggests that the major shifts were concentrated in essentials such as food and shelter, as well as in discretionary leisure spending.

2000

id wb1_pie_07

The pie charts below show the sources of electricity generation in one country in 2000, 2012 and 2024.

**Band 6**

167 words

All three charts covered with accurate figures · overview present but basic and placed last · paragraph-by-year structure is mechanical · limited range of linking and vocabulary · several agreement, tense and punctuation errors.

The three pie charts shows the different sources which was used to produce electricity in one country in 2000, 2012 and 2024.

In 2000 coal was the main source, it produced 52% of electricity. Gas was 20% and nuclear was 18%. Hydro was 8% and wind and solar were only 2%, which is very small.

In 2012 coal decreased to 38% but it was still the biggest source. Gas increased to 28% and wind and solar also increased to 9%. Nuclear was nearly the same with 17% and hydro did not change at all, it stayed at 8%.

In 2024 there was a big change. Wind and solar became the largest source with 34%, and gas was second with 30%. Coal dropped a lot to only 12%. Nuclear fell a little to 15% and hydro was 9%.

Overall, the country used less coal and much more wind and solar energy over the period, and gas also become more important, but nuclear and hydro stayed around the same.

Band 7

181 words

Clear overview of the main trends · key changes across three charts well highlighted · accurate figures with a valid derived comparison · logical progression and varied linking · mostly error-free sentences.

The pie charts illustrate how electricity was generated in one country in 2000, 2012 and 2024.

Overall, there was a dramatic shift away from coal towards wind and solar power over the period. Gas also became increasingly important, whereas nuclear and hydro power remained relatively stable.

In 2000, coal was by far the most important source, generating more than half of the country's electricity (52%). Gas and nuclear power accounted for 20% and 18% respectively, while hydro contributed 8%. Wind and solar were almost insignificant at this time, producing only 2%.

By 2012, the share of coal had fallen to 38%, although it was still the leading source. Meanwhile, gas rose to 28% and wind and solar grew to 9%. In 2024, however, the situation had changed completely. Wind and solar had become the largest source, at 34%, which was seventeen times its share in 2000. Gas continued to rise slightly to 30%, whereas coal dropped sharply to just 12%. Over the whole period, nuclear power declined only marginally, from 18% to 15%, and hydro stayed at around 8–9%.

Band 8

193 words

Key features skilfully selected across three charts · overview clear and well placed · accurate figures used for purposeful comparison · cohesion managed smoothly · precise vocabulary · wide range of error-free structures.

The charts compare the contribution of five energy sources to electricity generation in one country at three points between 2000 and 2024.

Over the period, the country's electricity mix was transformed: coal, initially the dominant source, was largely displaced by wind and solar power, with gas also expanding its share. Nuclear and hydroelectric generation, by contrast, remained fairly constant.

In 2000, coal supplied just over half of all electricity (52%), with gas (20%) and nuclear (18%) making up most of the remainder. Hydro accounted for 8%, and wind and solar generated a negligible 2%.

The following twelve years saw the beginning of a shift. Coal's share contracted to 38%, while gas climbed to 28% and wind and solar more than quadrupled to 9%. This trend accelerated markedly after 2012, so that by 2024 wind and solar had become the largest source, providing 34% of electricity, whereas coal had plummeted to only 12%, a fall of 40 percentage points since 2000. Gas edged up further to 30%, making it the second most important source. Throughout the period, nuclear power declined only slightly, from 18% to 15%, and hydro remained almost unchanged at 8–9%.

Waste collected, 2005

id wb1_pie_08

The charts below show the types of waste collected by a city council in 2005 and 2025.

**Band 6**

171 words

Key changes reported with accurate figures · overview placed at the end and a little repetitive · mechanical linking · adequate vocabulary · several article, tense and word-form errors that do not block meaning.

The charts give information about the different kinds of waste that a city council collected in 2005 and in 2025.

In 2005, food and garden waste was the biggest type with 34%, and paper and card was 24%. Plastics was 11%, glass was 9% and metals only 6%. Other waste was 16%. So the food and garden and the paper and card was more than the half of all waste.

In 2025, the food and garden waste was still the highest, but it decrease to 29%. Paper and card also fell down to 15%. On the other hand, plastics increased a lot to 22%, so it is the double of 2005. Other waste also went up to 22%. Glass and metals fell slightly to 7% and 5%.

Overall, the food and garden waste was the largest in the both years. The biggest change was plastics which doubled, and paper become less. The other types did not change very much in the twenty years, except the other waste which increased by 6%.

Band 7

175 words

Clear overview of the main features · key changes highlighted with accurate figures · logical progression · good range of linkers · appropriate vocabulary with some less common collocation · few errors.

The pie charts compare the proportions of different types of waste collected by a city council in 2005 and 2025.

Overall, food and garden waste remained the largest category in both years, although its share fell. The most noticeable changes were the sharp rise in plastics and the significant decline in paper and card.

In 2005, food and garden waste made up just over a third of all rubbish collected (34%), while paper and card accounted for almost a quarter (24%). Other waste represented 16%, and the three remaining materials were considerably smaller, with plastics at 11%, glass at 9% and metals at 6%.

Twenty years later, the proportion of food and garden waste had dropped slightly to 29%. Paper and card fell more steeply, to 15%. By contrast, the share of plastics doubled to 22%, making it the joint second largest category together with other waste, which also increased to 22%. Glass and metals both decreased marginally, to 7% and 5% respectively, so they continued to be the least significant types of waste.

Band 8

196 words

Key features skilfully selected · well-placed overview summarising the main shifts · accurate, selective use of figures and derived changes · cohesion managed naturally · precise vocabulary · wide range of structures with no errors.

The charts show how the waste collected by a city council was made up in 2005 and 2025, broken down into six categories.

While food and garden waste remained the single largest category throughout, the composition of the waste stream changed notably over the twenty years, most obviously through a doubling of plastics and a marked decline in paper and card.

In 2005, organic material from kitchens and gardens accounted for 34% of the total, followed by paper and card at 24%. Together, these two categories represented well over half of all waste collected. Plastics made up 11%, glass 9% and metals 6%, while unclassified waste constituted the remaining 16%.

By 2025, the share of food and garden waste had eased to 29%, and paper and card had declined more steeply, by 9 percentage points to 15%. Plastics, on the other hand, doubled from 11% to 22%, thereby overtaking paper to share second place with other waste, which had also grown to 22%. Glass and metals, already minor categories, each dipped slightly, to 7% and 5% respectively. Consequently, the gap between the largest and the smaller categories had narrowed considerably by the end of the period.

Purpose of visit, 2014

id wb1_pie_09

The pie charts below show the main reasons international visitors gave for travelling to one country in 2014 and 2024.

Band 6

171 words

Accurate figures covering all categories · overview only at the end · simple, repetitive linking and vocabulary · several agreement, preposition and tense errors that do not obscure meaning.

The pie charts shows the reasons of international visitors for coming to one country in 2014 and 2024.

In 2014, holiday was the most common reason with 44% of visitors. Business was the second reason, it was 28%, and visiting friends or relatives was 18%. Study and other reasons was both 5%. It means that holiday and business together was the reason for most of the visitors in 2014.

In 2024, holiday was still the main reason and it increased to 51%, so more than half visitors came for holiday. Business decreased a lot to 14%, which is half of 2014. Visiting friends and relatives increase a little to 21% and it became the second reason. Study also increased, it doubled from 5% to 10%. Other reasons went down slightly to 4%.

Overall, holiday was the main reason in both years. The biggest change was business which fell very much, while study and holiday became more popular than before. Visiting friends and relatives was also a bit more popular in 2024.

Band 7

178 words

Clear overview of the main changes · key features well highlighted and accurately supported · logical paragraphing · range of linkers with slight over-use of sequencing · one minor imprecision (number/share) · good vocabulary.

The pie charts illustrate the main purposes of international visitors travelling to one country in 2014 and 2024.

Overall, holidays were the most common reason for visiting the country in both years, and their share rose over the decade. The most significant change was the sharp fall in business travel, while the proportion of students doubled.

In 2014, 44% of visitors came on holiday, and business trips accounted for just over a quarter (28%). Visiting friends and relatives was the third most common purpose, at 18%, whereas study and other reasons each represented only 5% of visitors.

By 2024, holidaymakers made up more than half of all visitors (51%). In contrast, the share of business travellers halved, falling to 14%, which meant that visiting friends and relatives (21%) overtook business as the second most important reason. The number of people coming to study also increased noticeably, from 5% to 10%. Finally, the percentage of visitors travelling for other reasons remained almost unchanged, dipping slightly to 4%, so it was still the least common purpose of all.

Band 8

183 words

Key features skilfully selected with a clear overview · accurate figures used for precise comparison (halved, doubled) · sophisticated cohesion · wide, precise vocabulary · varied, error-free structures throughout.

The charts compare the reasons international visitors gave for coming to a particular country in 2014 and 2024.

Leisure travel dominated in both years and became even more prevalent over the decade, whereas business travel declined dramatically. Educational visits, though still a small category, also grew substantially.

In 2014, holidays were the purpose of 44% of visits, with business trips a clear second at 28%. A further 18% of visitors came to see friends or relatives, while study and other reasons were marginal, at 5% each.

Ten years later, the proportion of holidaymakers had risen to 51%, meaning that just over half of all visitors were tourists. The most striking change, however, was in business travel, whose share was exactly halved to 14%, causing it to slip behind visits to friends and relatives, which rose modestly to 21%. Study, meanwhile, doubled its share to 10%, becoming a considerably more significant motive than before, and the residual category of other reasons remained negligible at 4%. Taken together, these changes indicate that the country's visitor profile became increasingly centred on personal rather than professional travel.

Weekday

id wb1_pie_10

The pie charts below show how secondary school students in one country spent a typical weekday and a typical weekend day.

**Band 6**

175 words

All key figures reported accurately · brief overview placed at the end · mechanical linking and repetition · adequate vocabulary · several verb form, agreement and tense errors that do not impede communication.

The pie charts shows how students in secondary schools in one country used their time on a normal weekday and on a normal day at the weekend.

On a weekday, the biggest part of time was sleep with 35%, and school and lessons was nearly the same with 29%. Leisure and screens was 13%, meals and personal care was 9% and homework was 8%. Travel was the smallest activity at 6%. So on a weekday students used most of time for sleeping and studying.

At the weekend, students slept more, it was 40% of the day. The time for leisure and screens increased very much to 30%, it is more than double of the weekday. Meals and personal care went up to 12% and homework also went up to 10%. However, school and lessons fell to only 3%, and travel was 5%.

Overall, sleep took the most time in both days. On weekdays students spent a lot of time in school, but at the weekend they have much more free time for leisure and screens.

Band 7

177 words

Clear overview contrasting the two days · key differences highlighted with accurate figures · logical organisation · good range of linking devices · some less common vocabulary · frequent error-free sentences.

The pie charts compare how secondary school students in one country divided their time on a typical weekday and on a typical weekend day.

Overall, sleep took up the largest share of students' time on both types of day. The main difference was that school and lessons occupied a large part of the weekday, whereas leisure and screen time dominated students' waking hours at the weekend.

On weekdays, students spent 35% of their time asleep and 29% at school or in lessons. Leisure activities and screens accounted for 13%, followed by meals and personal care at 9% and homework at 8%. Travel took up the smallest proportion, at 6%.

At weekends, the proportion of time spent sleeping rose to 40%. More noticeably, leisure and screen time more than doubled to 30%, while school and lessons dropped to only 3%. Students also spent slightly more time on meals and personal care (12%) and on homework (10%) than they did on weekdays. The share of time devoted to travel, on the other hand, remained almost the same, at 5%.

Band 8

192 words

Key features skilfully selected and contrasted · clear, well-placed overview · selective and accurate comparison of figures · cohesion handled naturally · precise vocabulary (time released was absorbed) · wide range of error-free structures.

The charts illustrate how secondary school students in one country typically allocated their time across six activities on a weekday and on a weekend day.

Sleep accounted for the greatest share of time on both days, but the balance between formal education and leisure differed sharply: school dominated the waking hours of a weekday, whereas leisure and screen use largely took its place at weekends.

On a typical weekday, students slept for 35% of the day and spent almost as much time (29%) at school or in lessons. The remaining time was divided between leisure and screens (13%), meals and personal care (9%), homework (8%) and travel (6%).

At weekends, formal lessons shrank to a mere 3%, and the time released was absorbed mainly by leisure and screens, whose share rose to 30%, well over double the weekday figure. Students also slept more, with sleep accounting for 40% of the day. Interestingly, homework actually took up a slightly larger proportion of time at the weekend (10%) than during the week, and meals and personal care likewise increased, to 12%. Travel, meanwhile, was the only activity that remained virtually unchanged, at 5%.

University X graduates

id wb1_pie_11

The charts below show what graduates from two universities were doing six months after completing their degrees.

**Band 6**

164 words

Clear comparison with accurate figures · overview present but at the end and fairly general · paragraph-by-university organisation is mechanical · adequate vocabulary with some awkward phrasing · several agreement, tense and preposition errors.

The charts shows what the students who graduated from two universities, X and Y, were doing six months after they finish their degrees.

In University X, more than half of graduates had a full-time work, it was 58%. Further study was 17% and part-time work was 12%. Only 6% was unemployed and 7% did other things. So most of the graduates from University X were working six months after the graduation.

In University Y, full-time work was also the most common but the percentage was lower, only 41%. Further study was higher than University X with 26%, and part-time work was also higher at 19%. Unemployed was 9%, which is a little more than University X, and other was 5%.

Overall, the graduates from University X was more successful to find full-time jobs. On the other hand, more graduates from University Y decided to continue study or have a part-time job. In both universities the unemployed people was a small group, less than 10%.

Band 7

177 words

Clear overview of the key differences · main features well supported with accurate figures and valid totals · logical progression · range of cohesive devices · good vocabulary · frequent error-free sentences.

The pie charts compare the activities of graduates from two universities, X and Y, six months after they had completed their degrees.

Overall, full-time employment was the most common outcome for graduates from both universities, but it was considerably more prevalent at University X. Graduates of University Y, by contrast, were more likely to be in further study or part-time work.

At University X, well over half of graduates (58%) had found full-time jobs, while 17% had gone on to further study and 12% were working part-time. Only a small minority were unemployed (6%) or doing something else (7%).

At University Y, the proportion in full-time work was much lower, at 41%, which was 17 percentage points below the figure for University X. However, a larger share of Y's graduates were continuing their studies (26%) or had part-time jobs (19%). Unemployment was also slightly higher, at 9%, whereas the percentage in the other category was 5%. In total, 70% of University X graduates were in some form of employment, compared with 60% at University Y.

Band 8

188 words

Key features skilfully selected and compared category by category · clear overview · accurate figures with correct derived totals · cohesion managed smoothly · wide, precise vocabulary · varied structures, all error-free.

The charts show the destinations of graduates from University X and University Y six months after graduation.

Although full-time employment was the most frequent outcome for both groups, graduates of University X were markedly more likely to have secured a full-time post, whereas those from University Y were more often engaged in further study or part-time work.

Full-time work accounted for 58% of University X graduates but only 41% of their counterparts at University Y, a gap of 17 percentage points. Conversely, further study was considerably more common among University Y graduates (26%, against 17% for University X), and the same was true of part-time employment, at 19% compared with 12%.

The remaining categories were relatively small for both institutions. Unemployment stood at 6% for University X and slightly higher, at 9%, for University Y, while the proportion engaged in other activities was similar, at 7% and 5% respectively. Taking full-time and part-time work together, 70% of University X graduates were employed in some capacity six months after finishing their degrees, compared with three-fifths of those from University Y, indicating a noticeably stronger employment outcome for the former.

Sources of river pollution, 2023

id wb1_pie_12

The pie chart below shows the main sources of water pollution in a river basin in 2023.

Band 6

162 words

Accurate figures with relevant comparisons · overview placed late · linking is mechanical and sometimes misused (Firstly) · adequate vocabulary with repetition · several agreement and article errors that do not block meaning.

The pie chart shows the main causes of water pollution in a river basin in the year 2023.

As can be seen, agricultural run-off was the biggest source of the pollution with 37%. Urban sewage was the second one, it caused 26% of the pollution. Industrial discharge was also important and it was 18%.

The other sources was much smaller. Road drainage was 9% and mining was 6%. Other sources was the smallest part with just 4%. These three sources together was less than the urban sewage alone. Firstly, agricultural run-off was more than double of industrial discharge. Also, agriculture and sewage together was more than 60% of the total pollution, which is a very big part.

Overall, most of pollution in this river basin came from the agriculture, the cities and the industry. The three biggest sources together made 81% of pollution, and the three smallest sources only 19%. So farming was the most serious problem for the river in 2023.

Band 7

171 words

Clear overview with appropriate grouping of sources · key features highlighted with accurate figures and correct comparisons · logical paragraphing · varied cohesive devices · good vocabulary · mostly error-free.

The pie chart illustrates the proportion of water pollution in a river basin that came from six different sources in 2023.

Overall, agricultural run-off was the single largest source of pollution, and together with urban sewage and industrial discharge it was responsible for the vast majority of the total. The remaining sources made a relatively minor contribution.

Agricultural run-off accounted for 37% of all pollution, which was more than a third of the total. Urban sewage was the second most significant source, contributing just over a quarter (26%), while industrial discharge made up 18%. Taken together, these three sources represented 81% of the pollution in the river basin.

By contrast, the other three sources were much less important. Road drainage was responsible for 9% of the pollution, which was half the figure for industrial discharge. Mining contributed 6%, and other sources accounted for only 4%, the smallest share. It is also worth noting that agricultural run-off alone produced almost twice as much pollution as road drainage, mining and other sources combined.

Band 8

188 words

Key features skilfully selected and grouped · well-placed overview · accurate figures and derived comparisons used purposefully · cohesion seamless · precise vocabulary (attributable, contamination) · wide range of error-free structures.

The chart breaks down the sources of water pollution in a river basin in 2023 into six categories.

The most notable feature is the dominance of agricultural run-off, which was the largest single contributor. More broadly, pollution was concentrated in three main sources, with agriculture, urban sewage and industry together accounting for roughly four-fifths of the total.

Agricultural run-off was responsible for 37% of the pollution, more than double the share attributable to industrial discharge (18%). Urban sewage ranked second at 26%, so agricultural and domestic sources combined generated almost two-thirds of all contamination entering the river system. Industrial discharge completed the three principal sources, bringing their joint share to 81%.

The three remaining sources were considerably less significant. Run-off from roads accounted for 9%, precisely half the industrial figure, while mining contributed 6% and miscellaneous sources a mere 4%. Collectively, these minor sources made up less than a fifth of the pollution, which is less than the contribution of urban sewage on its own. This distribution suggests that pollution in the basin stemmed overwhelmingly from a small number of large-scale sources rather than being evenly spread.

Home language, 2005

id wb1_pie_13

The pie charts below show the main languages spoken at home by children in a city school district in 2005 and 2025.

Band 6

166 words

Relevant figures reported accurately · overview present at the end but somewhat general · mechanical linking · adequate vocabulary with repetition · several article, agreement and tense errors which do not impede meaning.

The two pie charts shows which languages children in a city school district were speaking at home in 2005 and in 2025.

In 2005, most of children spoke only English at home, it was 78%. Spanish was 9%, and Polish and Mandarin were both 3%. Arabic was only 2% and other languages was 5%. So in that year only a small number of children spoke a different language in their home.

In 2025, English only was still the biggest group but it decreased to 61%. All other languages increased. Spanish went up to 12% and it was still the second. Polish grew to 7% and Arabic to 6%, so Arabic become three times bigger than 2005. Mandarin also increased a little to 5%, and other languages went up to 9%.

Overall, the English only speakers was the majority in both years, but the percentage of children who speak another language at home increased. This means the school district was more mixed in 2025 than in 2005.

Band 7

179 words

Clear overview of the main trend · key changes highlighted with accurate figures and derived comparisons · logical progression · range of cohesive devices · good vocabulary with one slightly awkward phrase.

The pie charts illustrate the main languages spoken at home by children in a city school district in 2005 and 2025.

Overall, children who spoke only English at home made up the majority in both years, although their share fell considerably. Meanwhile, the proportions speaking every other language rose, making the district more linguistically diverse.

In 2005, more than three-quarters of children (78%) spoke only English at home. Spanish was the most common of the other languages, at 9%, followed by Polish and Mandarin, each at 3%, and Arabic at just 2%. Other languages together accounted for 5%.

By 2025, the percentage of English-only speakers had dropped to 61%. Spanish remained the second largest group, increasing to 12%. The most rapid growth, however, was seen in Arabic, which tripled from 2% to 6%, and Polish, which more than doubled to 7%. Mandarin rose more modestly to 5%, while the proportion speaking other languages increased to 9%. As a result, almost two in five children spoke a language other than only English at home by the end of the period.

Band 8

179 words

Key features skilfully selected · clear overview · accurate figures with purposeful derived comparisons (17 points, 22% to 39%) · smooth cohesion · precise vocabulary · wide range of accurate, complex structures.

The charts compare the languages that children in a city school district spoke at home in 2005 and 2025.

Although English-only households remained in the majority throughout, their share contracted markedly over the two decades, while every other language group expanded, pointing to a considerably more multilingual school population by 2025.

In 2005, English was the sole home language for 78% of children. Spanish was by far the most widely spoken alternative, at 9%, whereas Polish and Mandarin were each spoken by just 3% of pupils and Arabic by only 2%. Other languages accounted for the remaining 5%.

Twenty years later, the English-only group had fallen by 17 percentage points to 61%, meaning that the proportion of children speaking another language at home had risen from 22% to 39%. Spanish remained the leading minority language, edging up to 12%. The fastest growth, though, was in Arabic, which tripled to 6%, and Polish, which more than doubled to 7%, overtaking Mandarin in the process. Mandarin itself grew to 5%, and the combined share of other languages almost doubled, reaching 9%.

Service B Service E
Service C

Streaming market share, 2024

Service A Service D
Service B Service E
Service C

Band 6

167 words

All key figures included accurately · overview present but placed last and slightly imprecise (customers vs share) · repetitive linking · adequate vocabulary · several agreement, word-form and punctuation errors.

The pie charts show the market share of five video streaming services in a country in 2019 and in 2024.

In 2019, Service A was the biggest service by far, it had 52% of the market. Service B had 21% and Service C had 14%. Service D and Service E were very small with only 8% and 5%. So Service A had more than half of all the market in this year.

In 2024, Service A was still the most popular but its share fell down to 34%. Service B also decreased a little to 19%. On the other hand, the other three services grew. Service D increased very much to 17%, it is more than double. Service E also increased from 5% to 14% and Service C went up slightly to 16%.

Overall, Service A lost a lot of customers but it was still number one. The smaller services became more strong, so in 2024 the market was more equal between the services than in 2019.

Band 7

175 words

Clear overview of the key trend · main changes highlighted with accurate figures and correct derived values · logical progression · range of linkers · good collocations (market leader, lost ground) · few errors.

The pie charts compare the market shares held by five video streaming services in one country in 2019 and 2024.

Overall, Service A remained the market leader in both years, but its dominance declined significantly. At the same time, the smaller services, particularly D and E, grew considerably, so that the market became much more evenly divided.

In 2019, Service A controlled just over half of the market (52%). Service B was a distant second, with 21%, followed by Service C at 14%. Services D and E had only small shares, at 8% and 5% respectively.

By 2024, Service A's share had fallen to 34%, a drop of 18 percentage points. Service B also lost ground slightly, falling to 19%. In contrast, Service D more than doubled its share to 17%, overtaking Service C, which rose modestly to 16%. The most rapid growth was seen in Service E, which almost trebled its share from 5% to 14%. As a result, the gap between the largest and smallest services narrowed considerably over the five-year period.

Band 8

188 words

Key features skilfully selected with a clear overview · figures used selectively for comparison with accurate derived values · cohesion managed smoothly · precise vocabulary (unrivalled, marginal players) · wide range of error-free structures.

The charts show how the market for video streaming in one country was shared among five services in 2019 and 2024.

The market became noticeably more competitive over the five years: Service A retained the largest share but lost much of its dominance, while the smaller providers, especially Services D and E, made substantial gains.

In 2019, Service A was unrivalled, with 52% of the market, more than double the share of its nearest competitor, Service B (21%). Service C held 14%, and Services D and E were marginal players, with 8% and 5% respectively.

By 2024, Service A's share had shrunk to 34%, and although it was still the leader, it no longer accounted for even half of the market. Service B slipped slightly to 19%, whereas Service C edged up to 16%. The most striking gains were made by the two smallest services: Service D more than doubled its share to 17%, overtaking Service C, and Service E nearly trebled its share to 14%. Consequently, the four challengers together held around two-thirds of the market by 2024, compared with less than half five years earlier.

Council budget, 2010

id wb1_pie_15

The pie charts below show how a city council allocated its budget in 2010 and 2025.

**Band 6**

167 words

Accurate figures for all categories · overview placed last and repeats earlier points · mechanical linking · limited range of vocabulary · several agreement, article and verb form errors that do not affect clarity.

The pie charts shows how a city council spent its budget on six different areas in 2010 and in 2025.

In 2010, education received the most money with 34% of the budget. Social care was second with 22% and transport was 15%. Housing and administration was both 10%, and parks and culture got the least, only 9%.

In 2025, the situation changed. Social care became the biggest part of budget, it increased to 35%. Education decreased to 30% and so it was the second. Transport also went down to 12%. Parks and culture fell to 5% and administration fell to 7%. So the council gave less money for these areas than in 2010. Housing was the only other area which increase, but only a little to 11%.

Overall, the council spent more on social care in 2025 than in 2010, and less on almost all other areas. The biggest change was the social care, which went up by 13%, and the parks and culture was nearly halved.

Band 7

171 words

Clear overview identifying the main change · key features highlighted with accurate figures and correct derived values · logical paragraphing · good range of cohesive devices · appropriate vocabulary with few errors.

The pie charts illustrate how a city council divided its budget between six areas of spending in 2010 and 2025.

Overall, the most significant change was the large increase in the share of the budget spent on social care, which replaced education as the largest category. Most other areas received a smaller proportion of funding in 2025 than in 2010.

In 2010, education was allocated just over a third of the budget (34%), while social care accounted for 22%. Transport received 15%, and housing and administration were each given 10%. Parks and culture had the smallest share, at 9%.

By 2025, social care had risen by 13 percentage points to 35%, making it the council's main area of expenditure. Education, by contrast, dropped slightly to 30%. The shares for transport and administration also fell, to 12% and 7% respectively, and spending on parks and culture was almost halved, falling to only 5%. Housing was the only other category to see an increase, although this was very small, from 10% to 11%.

Band 8

197 words

Key features skilfully selected with a clear, well-placed overview · accurate, purposeful use of derived figures · smooth, well-managed cohesion · precise and natural vocabulary · wide range of structures, error-free.

The charts compare the allocation of a city council's budget across six service areas in 2010 and 2025.

The standout development over the fifteen-year period was the rapid growth of social care, which overtook education to become the largest item of expenditure. This expansion was accompanied by a shrinking share for most other services, nearly all of which received a smaller proportion of the budget by 2025.

In 2010, education absorbed 34% of council spending, comfortably ahead of social care at 22%. Transport accounted for 15%, while housing and administration each took 10%, and parks and culture received the smallest share, at 9%.

By 2025, the share devoted to social care had climbed to 35%, an increase of 13 percentage points, whereas education had slipped to 30%. Transport and administration were both cut back, to 12% and 7% respectively, but the sharpest proportional reduction was in parks and culture, whose share almost halved to just 5%. Housing was the only other area to gain funding, and even then only marginally, rising by a single point to 11%. Taken together, education and social care accounted for almost two-thirds of the budget in 2025, compared with 56% in 2010.

City A household rubbish

id wb1_pie_16

The pie charts below compare the materials found in household rubbish in two cities.

Band 6

162 words

Accurate comparison of both charts · overview placed at the end and somewhat general · repetitive structure and linking · adequate vocabulary · several agreement and comparative-form errors that do not block meaning.

The pie charts compare what kind of materials are in the household rubbish in two cities, City A and City B.

In City A, food waste was the largest part, it was 42% of the rubbish. Paper was 18% and plastics was 14%. Other materials was 12%, glass was 8% and textiles was the smallest with 6%. So nearly the half of rubbish in City A was food.

In City B, the situation was different. Paper was the biggest material with 29%, and food waste was only 22%, which is much more lower than City A. Plastics was 21% so it was higher than in City A too. Other was 13%, textiles was 9% and glass only 6%.

Overall, the rubbish in City A had mostly food waste, but in City B paper, plastics and food waste were more similar. Also City B had more paper and plastics than City A, and City A had more food and glass than City B.

Band 7

179 words

Clear overview of the main contrast · key features highlighted with accurate figures and valid comparisons · logical organisation · good range of linking devices · appropriate vocabulary with some repetition · few errors.

The pie charts compare the composition of household rubbish in two cities, City A and City B.

Overall, food waste was by far the largest component of household rubbish in City A, whereas in City B paper was the main material and the waste was more evenly distributed between the main categories.

In City A, food waste accounted for 42% of household rubbish, more than twice the proportion of paper, which was the second largest category at 18%. Plastics made up 14%, and other materials represented 12%. Glass and textiles were the least significant, at 8% and 6% respectively.

In City B, however, paper was the largest single category, at 29%, followed by food waste at 22%, which was 20 percentage points lower than in City A. Plastics also formed a considerably larger share than in City A, at 21%. Other materials accounted for 13%, a similar figure to City A, while textiles made up 9% and glass just 6%. Therefore, City B produced proportionally more paper, plastic and textile waste than City A, but much less food waste.

Band 8

191 words

Key contrasts skilfully selected · clear, well-placed overview · selective and accurate comparison of figures · sophisticated cohesion · precise vocabulary (constituted, composition) · wide range of error-free structures.

The charts compare the proportions of different materials found in household rubbish in City A and City B.

The most striking difference lies in the share of food waste, which dominated rubbish in City A but was far less prominent in City B, where paper and plastics made up a larger part of the total and the composition was more balanced overall.

In City A, food waste constituted 42% of household rubbish, almost twice the equivalent figure in City B (22%). Paper and plastics were considerably less significant, at 18% and 14% respectively, while glass (8%), textiles (6%) and other materials (12%) made up the remainder.

City B's rubbish, by contrast, was led by paper, which accounted for 29%, and plastics came a close third at 21%, one point behind food waste. Consequently, these three materials each represented roughly a fifth or more of the total, whereas in City A only food waste exceeded that level. Textiles were also somewhat more common in City B (9%), whereas glass was slightly less so (6%), and the proportion of other materials was virtually identical in the two cities, at 12% and 13%.

The pie charts shows what types of accommodation international tourists used in one country in 2008 and in 2023.

In 2008, hotels was the most popular type with 55% of tourists, it was more than half. Staying with friends or relatives was 17%. Hostels and campsites had the same, 10% each, and rented apartments was the least popular with only 8%. It shows that hotels was much more popular than any other type in 2008.

In 2023, hotels was still the most popular but the percentage fell to 39%. The biggest change was the rented apartments, they increased from 8% to 31%, so they became the second. However, the other types decreased a little. Friends and relatives went down to 15%, hostels to 8% and campsites to 7%.

Overall, most of tourists stayed in the hotels in both years, but in 2023 many more tourists chose rented apartments than before. The other kinds of accommodation did not change very much during this time.

Band 7

175 words

Clear overview of the main trends · key features well presented with accurate figures and a correct derived comparison · logical progression · range of cohesive devices · good vocabulary · mostly error-free.

The pie charts illustrate the types of accommodation used by international tourists visiting one country in 2008 and 2023.

Overall, hotels were the most popular form of accommodation in both years, although their share fell considerably. The most significant change was the dramatic rise in the popularity of rented apartments, while the other types of accommodation all declined slightly.

In 2008, more than half of international tourists (55%) stayed in hotels. Staying with friends or relatives was the second most common option, at 17%, while hostels and campsites each accounted for 10%. Rented apartments were the least popular choice, used by only 8% of visitors.

By 2023, the proportion of tourists staying in hotels had dropped to 39%. In contrast, the share using rented apartments rose sharply to 31%, which was almost four times the 2008 figure, and this category became the second most popular. The remaining types of accommodation saw small decreases: the figure for friends or relatives fell to 15%, hostels to 8% and campsites to 7%, making campsites the least used option.

Band 8

190 words

Key features skilfully selected · clear overview · accurate figures used selectively with precise derived comparisons · cohesion managed skilfully · wide, precise vocabulary · varied, error-free structures.

The charts compare the types of accommodation chosen by international tourists in one country in 2008 and 2023.

While hotels remained the most common choice throughout, their lead was greatly reduced by the rapid growth of rented apartments, which had become a serious rival by 2023. All the other forms of accommodation lost a small amount of ground.

In 2008, hotels were used by 55% of international visitors, over three times as many as those staying with friends or relatives (17%). Hostels and campsites were each chosen by a tenth of tourists, and rented apartments were the least popular option, accounting for just 8%.

Fifteen years later, the proportion staying in hotels had declined by 16 percentage points to 39%. Rented apartments were the clear winners over the period, their share almost quadrupling to 31%, which meant that the gap between hotels and apartments had narrowed from 47 points to only 8. Meanwhile, the remaining categories each dipped slightly: staying with friends or relatives fell to 15%, hostels to 8% and campsites to 7%, so campsites went from joint third place to become the least popular type of accommodation.

Emissions by sector, 1990

id wb1_pie_18

The charts below show greenhouse gas emissions by sector in one country in 1990 and 2020.

Band 6

164 words

All figures reported accurately · overview present but only at the end · linking is adequate but mechanical · some repetition of vocabulary · several agreement, determiner and article errors that do not obscure meaning.

The pie charts show how much greenhouse gas was produced by different sectors in one country in 1990 and 2020.

In 1990, energy supply was the biggest sector with 36% of emissions. Industry was the second with 22%, and transport was 16%. Buildings produced 14%, agriculture 9% and waste only 3%, so waste was the smallest one. Energy supply and industry together made more than a half of all emissions.

In 2020, there was a lot of change. Transport became the largest sector, it increased to 27%. Energy supply decreased a lot to 21%, but it was still the second biggest. Buildings went up to 18% and it was higher than industry, because industry fell down to 17%. Agriculture also rose to 13% and waste rose a little to 4%.

Overall, in 1990 energy supply produced the most emissions but in 2020 transport was the main sector. Energy supply and industry went down, while all of the other sectors increased during these thirty years.

Band 7

178 words

Clear overview of the main changes · key features highlighted and supported with accurate figures · logical progression · varied linking devices · good vocabulary (emitting sector, contributor) · mostly error-free.

The pie charts compare the proportions of greenhouse gas emissions produced by six sectors in one country in 1990 and 2020.

Overall, energy supply was the largest source of emissions in 1990, but it had been overtaken by transport by 2020. While the shares of energy supply and industry declined, those of all the other sectors increased.

In 1990, energy supply accounted for more than a third of emissions (36%), followed by industry at 22% and transport at 16%. Buildings were responsible for 14%, and agriculture and waste contributed the smallest shares, at 9% and 3% respectively.

By 2020, the share of emissions from energy supply had fallen sharply to 21%, while industry's share had also dropped, to 17%. In contrast, transport saw a significant rise of 11 percentage points, reaching 27% and becoming the largest emitting sector. Buildings also increased their share to 18%, overtaking industry, and agriculture rose to 13%. Waste remained the smallest contributor, with only a slight increase to 4%. Consequently, the gap between the largest and smallest sectors became narrower over the period.

Band 8

190 words

Key features skilfully selected with a clear, well-placed overview · accurate figures used selectively with correct derived values · cohesion well managed · precise vocabulary · wide range of structures with no errors.

The charts break down one country's greenhouse gas emissions by sector in 1990 and 2020.

The most notable change over the thirty years was that transport replaced energy supply as the principal source of emissions. More generally, the shares attributable to energy supply and industry contracted, while every other sector accounted for a larger proportion by 2020.

In 1990, energy supply was responsible for 36% of emissions, well ahead of industry (22%) and transport (16%). Buildings contributed 14%, and agriculture and waste were comparatively minor sources, at 9% and 3% respectively.

By 2020, the picture had been transformed. The share generated by energy supply had dropped by 15 percentage points to 21%, and industry's contribution had also shrunk, to 17%. Transport, by contrast, rose from 16% to 27%, making it the largest single source of emissions. Buildings and agriculture both gained ground as well, reaching 18% and 13% respectively, so that buildings overtook industry. Waste remained the smallest category, edging up by just one point to 4%. As a result, emissions were spread more evenly across the main sectors at the end of the period than at the beginning.

2005

id wb1_pie_19

The pie charts below show the main sources of news used by adults in one country in 2005, 2015 and 2025.

**Band 6**

164 words

All three charts described with accurate figures · overview present but placed last · year-by-year structure is mechanical · limited range of vocabulary and linking · several agreement, article and tense errors.

The three pie charts shows where adults in one country got their news in 2005, 2015 and 2025.

In 2005, television was the most popular source with 48%. Newspapers was second with 27%, radio was 13% and news websites was 10%. Social media was very small with only 2%.

In 2015, television was still first but it fell to 40%. Newspapers dropped a lot to 14% and radio also fell to 10%. On the other hand, news websites increased to 22% and social media also increased to 14%, so it was same as newspapers.

In 2025, social media became the most popular source, it was 36%. Television decreased again to 29%. News websites was nearly same with 21%. Newspapers and radio fell down more, to only 6% and 8%.

Overall, the traditional sources like television, newspapers and radio become less popular during the twenty years, but social media and news websites grew a lot, and social media was the number one source in 2025.

Band 7

171 words

Clear overview of the main trends across three charts · key features highlighted with accurate figures and correct derived comparisons · logical progression · range of cohesive devices · few errors.

The pie charts illustrate the main sources of news used by adults in one country in 2005, 2015 and 2025.

Overall, traditional media such as television, newspapers and radio became steadily less popular over the twenty-year period, while online sources grew. Most notably, social media rose from being the least used source to the most popular.

In 2005, almost half of adults (48%) relied mainly on television for news, and newspapers were the second most common source, at 27%. Radio and news websites accounted for 13% and 10% respectively, while only 2% of people used social media.

Ten years later, the share of television had dropped to 40%, and the figure for newspapers had almost halved, to 14%. News websites, however, more than doubled to 22%, and social media also expanded rapidly to 14%. By 2025, social media had become the leading source of news, at 36%, overtaking television, which fell to 29%. News websites remained stable at 21%, whereas newspapers and radio continued to decline, reaching just 6% and 8%.

Band 8

191 words

Key trends skilfully selected across three charts · clear, well-placed overview · accurate figures and derived comparisons used purposefully · seamless cohesion · precise vocabulary (eroded, dwindled) · wide range of error-free structures.

The charts compare the main sources from which adults in one country obtained their news at three points between 2005 and 2025.

Over the two decades, there was a pronounced shift from traditional to digital media.

Television, newspapers and radio all lost popularity, while social media grew from a negligible share to become the leading source of news.

In 2005, television was clearly dominant, used by 48% of adults, and newspapers were a strong second at 27%. Radio (13%) and news websites (10%) played a smaller role, and social media was used by a mere 2%.

By 2015, the balance was beginning to change. Television's share had eroded to 40%, and newspapers had lost roughly half of their audience share, falling to 14%. At the same time, news websites more than doubled to 22%, and social media drew level with newspapers at 14%. The following decade saw this shift accelerate: social media surged to 36%, eighteen times its 2005 figure, overtaking television, which slipped to 29%. News websites held steady at 21%, whereas newspapers dwindled to just 6%, less than a quarter of their original share, and radio fell to 8%.

Clear overview of the main shift · key features highlighted with accurate figures and correct multiples · logical paragraphing · good range of linkers · appropriate less common vocabulary · mostly error-free sentences.

The pie charts compare the occupations of working women in one country in 1970 and 2020.

Overall, there was a significant shift from clerical and manufacturing work towards professional and managerial roles over the fifty-year period. Professional occupations replaced clerical work as the most common type of employment for women.

In 1970, almost a third of working women (32%) were employed in clerical positions, and a further 21% worked in manufacturing. Retail and sales and domestic and care work each accounted for 17%, while professional jobs made up 10%. Only 3% of women held managerial posts.

By 2020, the proportion of women in professional jobs had more than tripled to 31%, and the share in managerial roles had risen fivefold to 15%. In contrast, clerical work fell to 17%, and manufacturing saw the sharpest decline, dropping from 21% to just 5%. The remaining categories changed very little, with retail and sales decreasing slightly to 14% and domestic and care increasing marginally to 18%. As a result, domestic and care work became the second largest category in 2020.

Key features skilfully selected · clear, well-placed overview · accurate, selective comparison with correct derived values · cohesion managed naturally · precise, varied vocabulary · wide range of structures, error-free.

The charts illustrate how the occupations of working women in one country changed between 1970 and 2020.

The overall pattern is a marked movement away from clerical and manufacturing work towards higher-level professional and managerial positions, with professional work becoming the most common occupation by 2020. Domestic and care work, by contrast, remained remarkably stable.

In 1970, clerical jobs employed the largest share of working women, at 32%, and manufacturing accounted for a further 21%, so together these two sectors employed more than half of the female workforce. Retail and sales and domestic and care work each represented 17%, whereas professional occupations made up only 10% and managerial roles a mere 3%.

Fifty years later, professional work had risen to 31%, more than three times its earlier level, and the share of women in managerial positions had increased fivefold to 15%. Meanwhile, clerical work had almost halved to 17%, and manufacturing had undergone the steepest decline, shrinking to just 5% of female employment. Retail and sales fell only slightly, to 14%, and domestic and care work edged up by a single point to 18%, making it the second largest category.

Underground railway systems in six cities

id wb1_table_01

The table below gives information about the underground railway systems in six cities.

Underground railway systems in six cities

City	Year opened	Route length (km)	Passengers per year (millions)
Riverton	1890	402	1,210
Castelle	1902	225	1,450
Norwick	1935	118	520
Ashbury	1967	96	310
Port Maren	2001	184	870
Delmont	2014	62	145

Band 6 190 words

Key features covered with accurate figures · overview present but placed at the end · mechanical linking (Firstly, Also) · adequate vocabulary · several agreement and article errors that do not block meaning.

The table show information about the underground railway systems in six different cities, including the year each one was opened, the length of the route and how many passengers use it every year.

Firstly, the oldest system is in Riverton, which opened in 1890, and it is also the longest with 402 km of route. Castelle opened in 1902 and has 225 km, but it carries the most passengers, about 1,450 million per year. Riverton is in second place with 1,210 million passengers. Norwick system was opened in 1935 and it have 118 km and 520 million passengers.

Also, the newer systems are smaller in general. Ashbury opened in 1967 and it has only 96 km and 310 million passengers. Port Maren is quite new, it opened in 2001, but it is bigger than Norwick and Ashbury with 184 km and 870 million passengers. The newest one is Delmont in 2014 and it is the smallest in the both length and passengers, with 62 km and 145 million.

Overall, the older underground systems are usually longer and busier than the newer ones, although Port Maren is a exception.

Band 7 201 words

Clear overview of the age-size pattern · key features highlighted and compared · logical grouping by period · good range of linking and some less common vocabulary · one or two minor imprecisions.

The table compares six cities' underground railway networks in terms of when they opened, how long their routes are and how many passengers they carry annually.

Overall, the older systems tend to be both more extensive and more heavily used, while the most recently built networks are generally smaller. Castelle and Riverton stand out as by far the busiest systems.

Riverton has the oldest network, dating from 1890, and it is also the longest at 402 km. However, it is Castelle, opened twelve years later in 1902, that carries the highest number of passengers, with 1,450 million a year compared with Riverton's 1,210 million, despite having a

route of only 225 km. Norwick, which opened in 1935, has a much shorter network of 118 km and serves 520 million passengers.

Of the later systems, Port Maren, opened in 2001, is the most significant, with 184 km of route and 870 million passengers, which is more than Norwick and Ashbury. Ashbury's system, built in 1967, is only 96 km long and is used by 310 million people each year. Finally, Delmont has the newest and smallest network, having opened in 2014 with just 62 km and 145 million passengers annually.

Band 8

204 words

Well-placed overview identifying the overall correlation and its exception · figures selected skilfully for comparison · cohesion managed effortlessly · precise, natural vocabulary · wide range of structures, virtually error-free.

The table provides details of the underground railway networks in six cities, specifically their opening dates, route lengths and annual passenger numbers.

In general, there is a broad correlation between age and scale: the earliest networks are the most extensive and carry the greatest numbers of passengers, whereas those opened more recently are considerably smaller. The one notable exception to this pattern is Port Maren.

The two oldest systems clearly dominate. Riverton's network, opened in 1890, is the longest by a wide margin at 402 km, almost twice the length of Castelle's 225 km. Nevertheless, Castelle, which dates from 1902, is the busiest, handling 1,450 million passengers a year against Riverton's 1,210 million. Norwick (1935) and Ashbury (1967) operate far more modest systems of 118 km and 96 km respectively, with annual ridership of 520 million and 310 million.

Port Maren breaks the trend. Although it did not open until 2001, its network of 184 km is the third longest, and it carries 870 million passengers annually, well ahead of both Norwick and Ashbury. Delmont, by contrast, has the youngest and smallest system: opened in 2014, it covers just 62 km and serves 145 million passengers, exactly a tenth of Castelle's total.

Adults aged 25-34 with a university degree (%)

id wb1_table_02

The table below shows the percentage of people aged 25-34 who held a university degree in five countries in 2000, 2010 and 2020.

Adults aged 25-34 with a university degree (%)

Country	2000	2010	2020
South Korea	37	63	70
Canada	48	56	64
United Kingdom	29	46	57
Germany	22	26	36
Italy	10	21	29

Band 6

164 words

Accurate figures but organised year by year, so comparison is mechanical · basic overview placed at the end · repetitive vocabulary (had, was) · several tense and word-form errors that do not impede meaning.

The table shows the percentage of people between 25 and 34 years old who had a university degree in five countries in the years 2000, 2010 and 2020.

In 2000, Canada had the highest percentage with 48%, and South Korea was second with 37%. The United Kingdom was 29% and Germany was 22%. Italy had the lowest percentage, only 10%.

In 2010 the figures increased in all countries. South Korea increase a lot to 63% and it become the highest, more than Canada which was 56%. The UK also went up to 46%, but Germany only increased a little to 26%. Italy percentage was 21%, that is double than 2000.

In 2020, all the countries continued to rise. South Korea reached to 70% and Canada was 64%. The UK had 57%, Germany had 36% and Italy had 29%, which was still the lowest.

Overall, the percentage of young adults with a degree went up in every country and South Korea had the biggest increase.

Band 7

199 words

Clear overview of universal growth and the change in leader · key trends highlighted with apt comparisons · logical paragraphing · good range of vocabulary · mostly accurate grammar with one tense slip.

The table illustrates the proportion of 25- to 34-year-olds holding a university degree in South Korea, Canada, the UK, Germany and Italy at three points between 2000 and 2020.

Overall, the proportion of graduates in this age group grew steadily in all five countries. South Korea saw the most dramatic growth and replaced Canada as the leader, whereas Germany and Italy remained well behind the others throughout.

At the start of the period, Canada had the highest figure at 48%, followed by South Korea at 37%. Over the next decade, however, the Korean figure rose sharply to 63%, overtaking Canada, which reached 56%. By 2020, 70% of young South Koreans held a degree, compared with 64% of Canadians. The UK also experienced considerable growth, with its percentage

almost doubling from 29% to 57%.

The two remaining countries had much lower levels of graduates. In Germany the percentage increased only slightly from 22% to 26% in the first decade, before rising more quickly to 36% in 2020. Italy began with the lowest rate of just 10%, but this figure has nearly tripled to 29% by the end of the period, although it was still the lowest of the five countries.

Band 8

198 words

Clear, well-placed overview · skilful selection of absolute and relative changes · cohesion handled naturally · precise vocabulary (surged, lagged behind, marginal) · wide range of accurate structures.

The table compares the percentage of adults aged 25–34 with a university degree in five countries in 2000, 2010 and 2020.

The most striking feature is that graduate rates increased in every country over the two decades, although the scale of growth varied considerably. South Korea overtook Canada to occupy first place, while Italy and Germany consistently lagged behind.

South Korea's rise was the most remarkable. Starting at 37% in 2000, its rate surged to 63% in 2010 and reached 70% by 2020, a gain of 33 percentage points overall. Canada, which had led at the beginning of the period with 48%, recorded far steadier growth of eight points per decade, ending at 64%. The United Kingdom's figure almost doubled, climbing from 29% to 57%, so that it had drawn much closer to the two leading nations by the end.

At the lower end of the table, progress was more uneven. Germany saw only a marginal increase in the first decade, from 22% to 26%, before a more substantial rise to 36%. Italy, meanwhile, remained at the bottom throughout, yet its rate nearly tripled, from 10% to 29%, which represents the largest relative increase of any country.

Working hours and paid holiday, full-time workers, 2023

id wb1_table_03

The table below shows average weekly working hours and the number of days of paid annual holiday for full-time workers in six countries.

Working hours and paid holiday, full-time workers, 2023

Country	Average weekly hours	Paid holiday (days per year)	Public holidays (days)
Country A	36.5	30	9
Country B	41.8	10	11
Country C	39.2	25	12
Country D	44.6	14	16
Country E	37.9	28	8
Country F	42.3	20	13

Band 6

182 words

All three columns covered accurately but described separately with little comparison · brief overview at the end · repetitive linking and verbs · several subject-verb agreement errors that do not block meaning.

The table give information about the average hours that full-time workers work each week and how many days of paid holiday and public holidays they have in six countries in 2023.

Looking at working hours, Country D has the longest week with 44.6 hours, then Country F with 42.3 hours and Country B with 41.8 hours. Country C workers work 39.2 hours. On the other hand, Country A has the shortest working week, only 36.5 hours, and Country E is similar with 37.9 hours.

About paid holiday, Country A is the highest with 30 days and Country E has 28 days. Country C also have a lot, 25 days. However, Country B workers only get 10 days, which is the lowest, and Country D get 14 days. Country F is in the middle with 20 days.

For public holidays, the numbers is more similar. Country D has the most with 16 days, and Country E has the least with 8 days. The others are between 9 and 13 days.

Overall, the countries where people works longer hours usually have less paid holiday.

Band 7

201 words

Clear overview identifying the link between hours and leave · countries logically grouped · range of cohesive devices, slightly heavy use of respectively · good collocations · one agreement slip.

The table compares six countries in terms of the average number of hours full-time employees worked per week in 2023, together with their entitlement to paid annual leave and the number of public holidays.

Overall, there appears to be an inverse relationship between working hours and paid holiday: countries with shorter working weeks generally offer considerably more annual leave. Public holidays, by contrast, vary much less between the countries.

Country A has the shortest average week, at 36.5 hours, and also the most generous holiday allowance, with 30 days. Country E and Country C follow a similar pattern, with working weeks

of 37.9 and 39.2 hours respectively and 28 and 25 days of paid leave.

At the other end of the scale, employees in Country D work the longest hours, averaging 44.6 per week, yet they receive only 14 days of paid holiday. Similarly, workers in Country F and Country B put in 42.3 and 41.8 hours, and are entitled to 20 and 10 days respectively, with Country B's figure being the lowest in the table. As for public holidays, these range from 8 days in Country E to 16 in Country D, which partly compensate for its limited annual leave.

Band 8

213 words

Insightful overview contrasting leave with public holidays · data grouped and synthesised (combined days off) · seamless cohesion · precise, flexible vocabulary · wide range of structures, error-free.

The table sets out the average weekly working hours of full-time employees in six countries in 2023, alongside the number of days of paid annual leave and public holidays they received.

Longer working weeks generally go hand in hand with less paid leave, whereas the number of public holidays varies within a narrow range and does not follow the same pattern.

Country A offers the most favourable conditions, combining the shortest average week of 36.5 hours with the largest leave entitlement of 30 days. Countries E and C are broadly comparable, with employees working 37.9 and 39.2 hours respectively and receiving 28 and 25 days of paid holiday. When public holidays are included, workers in these three countries enjoy between 36 and 39 days off a year.

The picture is markedly different in Countries D, F and B, where average hours exceed 41. Country D has the longest working week, at 44.6 hours, and just 14 days of annual leave, although its 16 public holidays are the highest figure in the table. Country B stands out for the least generous leave allowance of only 10 days, a third of that in Country A, despite a working week of 41.8 hours, while Country F sits between these extremes at 42.3 hours and 20 days.

Consumer spending by category, 2022 (% of total)

id wb1_table_04

The table below shows the proportion of total consumer spending on six categories in five countries in 2022.

Consumer spending by category, 2022 (% of total)

Country	Food & drink	Housing	Transport	Health	Education	Leisure
Country A	12	26	14	8	4	36
Country B	28	18	11	5	9	29
Country C	19	31	16	7	2	25
Country D	35	22	9	3	11	20
Country E	15	24	18	12	3	28

Band 6

174 words

Main categories covered with accurate figures · overview present but basic and at the end · mechanical, list-like organisation · limited vocabulary range · several agreement and tense errors that do not impede meaning.

The table shows how people in five countries spent their money on six different categories in 2022, as a percentage of total spending.

Firstly, leisure was the biggest category in many countries. In Country A it was 36%, which is the highest in the table, and Country B and Country E spent 29% and 28% on it. Country D spent only 20%.

Housing was also important. Country C spent the most on housing with 31%, and Country A and Country E spent 26% and 24%. Country D spent 22% and Country B spent 18%, it was the lowest.

For food and drink, there was big differences. Country D spent 35% of their money on food, which was more than any other category in that country. Country B was 28% but Country A only spent 12%.

Health and education was the smallest categories in all countries. Health was between 3% and 12%, and education was between 2% and 11%.

Overall, leisure and housing took the biggest part of spending, while health and education was small.

Band 7

203 words

Clear overview with the main exception noted · key features selected and compared · logical progression by category · good range of vocabulary (devoted, accounted for) · mostly error-free, slight repetition of spending.

The table illustrates how consumer spending was divided among six categories in five countries in 2022, expressed as a percentage of the total.

Overall, leisure and housing accounted for the largest shares of spending in most of the countries, whereas health and education made up the smallest proportions everywhere.

Country D was the main exception, as food and drink was its biggest category.

Leisure was the top category in three countries. It represented more than a third of all spending in Country A, at 36%, and slightly less in Country B and Country E, at 29% and 28% respectively. Housing, meanwhile, was the largest item in Country C, at 31%, and took between 18% and 26% of the budget in the other countries.

Spending on food and drink varied widely. Consumers in Country D devoted 35% of their spending to this category, almost three times as much as those in Country A, where the figure was only 12%. In contrast, health and education received relatively little in all five countries. Health spending ranged from 3% in Country D to 12% in Country E, while the proportion spent on education was lowest in Country C at 2% and highest in Country D at 11%.

Band 8

202 words

Clear overview capturing the general pattern and the outlier · figures selected purposefully with accurate ratios · very well-managed cohesion · wide, precise vocabulary · wide range of structures used accurately.

The table breaks down consumer expenditure in five countries in 2022 into six categories, showing each as a proportion of total spending.

It is clear that spending priorities differed considerably between the countries. Leisure and housing generally absorbed the largest shares, while health and education consistently attracted the least, although Country D departed from the general pattern by spending most heavily on food and drink.

Leisure was the single largest category in Countries A, B and E, accounting for 36%, 29% and 28% of expenditure respectively. In Country A, this was three times the share allocated to food and drink, which, at 12%, was the lowest food figure in the table. Country C, by contrast, spent most on housing (31%), with leisure making up a quarter of its total.

Country D presents a notably different profile. Food and drink made up 35% of its spending, well ahead of housing at 22% and leisure at 20%, and it also devoted the highest proportion to education, at 11%. However, it allocated only 3% to health, the smallest share for this category, whereas Country E spent 12%, four times as much. Education was a minor expense elsewhere, falling as low as 2% in Country C.

Average weekly consumption per person (grams)

id wb1_table_05

The table below shows the average amount of six types of food eaten per person per week in one country in 1980, 2000 and 2020.

Average weekly consumption per person (grams)

Food type	1980	2000	2020
Red meat	650	520	410
Poultry	190	310	430
Fish	160	150	135
Fresh fruit	540	700	760
Bread	950	780	610
Confectionery	120	175	160

Band 6

177 words

All six foods covered with accurate figures · simple overview only at the end · rising and falling items grouped but described mechanically · several verb-form and tense errors that do not obscure meaning.

The table shows how many grams of six kinds of food people in one country eat each week on average in 1980, 2000 and 2020.

Firstly, bread was the most eaten food in 1980 with 950 grams, but it decreased to 780 grams in 2000 and 610 grams in 2020. Red meat also go down from 650 grams to 520 grams and then 410 grams. Fish was quite stable, it fell a little from 160 to 150 and then to 135 grams.

On the other hand, some foods became more popular. Fresh fruit increased from 540 grams to 700 grams in 2000, and in 2020 it was 760 grams, so it was the most eaten food at the end. Poultry rised a lot too, from 190 grams to 430 grams, and it was more than red meat in 2020. Confectionery went up from 120 to 175 grams in 2000 but after that it drop slightly to 160 grams.

Overall, people eat less bread, red meat and fish, and they eat more fruit, poultry and sweets than before.

Band 7

204 words

Clear overview highlighting the two key reversals · logical grouping of falling and rising foods · good range of cohesive devices and trend vocabulary · mostly accurate grammar with a minor article slip.

The table illustrates changes in the average weekly consumption per person of six food types in one country over a forty-year period from 1980 to 2020.

Overall, there was a clear shift in eating habits. The consumption of bread, red meat and fish declined, whereas people ate considerably more poultry and fresh fruit. By 2020, fruit had replaced bread as the most consumed item, and poultry had overtaken red meat.

In 1980, bread was eaten in the largest quantities, at 950 grams per week, followed by red meat at 650 grams. However, both fell steadily over the following decades, with bread dropping to 610 grams and red meat to 410 grams in 2020. Fish consumption also decreased, although

only marginally, from 160 to 135 grams.

In contrast, the amount of fresh fruit eaten rose from 540 grams to 700 grams in 2000, and continued to increase to 760 grams by the end of period. The growth in poultry consumption was even more dramatic, as it more than doubled from 190 grams to 430 grams, making it slightly more popular than red meat. Confectionery showed a different pattern: it rose from 120 to 175 grams between 1980 and 2000 before falling back to 160 grams.

Band 8

201 words

Well-placed overview identifying both reversals · figures used selectively with accurate proportional comparisons · cohesion managed naturally · precise, varied trend vocabulary · wide range of structures, error-free.

The table details how much of six different foods the average person in one country consumed each week in 1980, 2000 and 2020, measured in grams.

The data reveal a marked change in diet over the four decades. Consumption of bread, red meat and fish fell consistently, while that of poultry and fresh fruit grew. As a result, by 2020 fresh fruit had overtaken bread as the most widely eaten item, and poultry had edged ahead of red meat.

Bread was by far the most heavily consumed food in 1980, at 950 grams a week, but this figure dropped by more than a third to 610 grams by 2020. Red meat followed a similar downward path, falling from 650 to 410 grams. Fish intake was the most stable of the declining items, easing only slightly from 160 to 135 grams.

Poultry saw the most dramatic growth, more than doubling from 190 to 430 grams. Fresh fruit also became increasingly popular, rising from 540 grams in 1980 to 700 grams in 2000 and 760 grams at the end of the period. Confectionery was the only item to fluctuate, climbing from 120 to 175 grams in 2000 before dipping slightly to 160 grams.

190 words

Relevant overview and accurate figures · key changes identified but presented as a list with limited comparison · repetitive vocabulary · comma splices and agreement errors that do not block meaning.

The table shows the most popular countries where students from one country went to study abroad in 2012 and 2024, and it show the number of students and the share.

Overall, the total number of students increased from 56,000 to 72,800, and the United States was the most popular destination in both years, but its share became smaller.

In 2012, 21,400 students went to the United States, it was 38% of all students. This number decreased to 18,900 in 2024 and the share fell to 26%. The United Kingdom was the second in both years. The number of students increased from 12,300 to 15,300, however the share was almost same, 22% and 21%.

Canada had the biggest change. In 2012 only 5,600 students studied there, but in 2024 the number was 14,600 and the share went up from 10% to 20%. Australia also increased from 8,400 to 13,100 students. Germany was the least popular but the number of students more than doubled, from 2,800 to 5,800. Other countries was 5,500 in 2012 and 5,100 in 2024.

Band 7

214 words

Clear overview of overall growth and shifting shares · numbers and percentages linked effectively · logical progression · good lexical range (dominance, overtook) · frequent error-free sentences, slight repetition of rising.

The table compares the numbers and proportions of students from one country who went abroad to study in the five most popular destinations in 2012 and 2024.

Overall, the total number of international students grew considerably over the period. Although the United States remained the leading destination, its dominance declined, while Canada experienced the most significant growth.

The total rose from 56,000 in 2012 to 72,800 in 2024. In the first year, the US attracted 21,400 students, accounting for 38% of the total, but by 2024 this figure had fallen to 18,900, or just 26%. The United Kingdom was the second most popular choice in both years, with student numbers rising from 12,300 to 15,300, although its share stayed almost unchanged at around a fifth.

Canada saw a remarkable increase, with the number of students choosing it rising from 5,600 to 14,600. As a result, its share doubled from 10% to 20%, and it overtook Australia, which also grew from 8,400 to 13,100 students. Germany was the least popular of the named destinations, but its numbers more than doubled to 5,800, raising its share from 5% to 8%. Meanwhile, the number going to other countries fell slightly, from 5,500 to 5,100.

Band 8

215 words

Perceptive overview on the more even spread of students · absolute and proportional data integrated skilfully · cohesion effortless · precise vocabulary (slipped, edged down) · wide range of complex structures, error-free.

The table presents data on the five leading study-abroad destinations for students from one country, giving both the number of students and each destination's share of the total in 2012 and 2024.

The most notable development is that, while overall numbers rose substantially, the United States lost much of its dominance, with Canada emerging as the fastest-growing destination. As a result, students in 2024 were spread far more evenly across the main countries.

Between the two years, the total number of students studying overseas increased by 16,800, from 56,000 to 72,800. The United States was the only major destination to attract fewer students, as its intake slipped from 21,400 to 18,900, causing its share to shrink from 38% to 26%. The United Kingdom, in second place in both years, gained 3,000 students, reaching 15,300, yet its share remained virtually stable at 21–22%.

Canada's rise was particularly striking: its student numbers grew more than two and a half times, from 5,600 to 14,600, doubling its share to 20% and lifting it above Australia (13,100). Germany, though still the smallest named destination, also more than doubled its intake to 5,800, whereas the figure for other countries edged down from 5,500 to 5,100.

Relevant overview and accurate data · both services covered but details listed region by region with little comparison · mechanical linking (Firstly, Secondly) · agreement errors and comma splices that do not impede meaning.

The table shows the percentage of people who had access to safe drinking water and basic sanitation in five regions of the world in 2000 and 2020.

In general, access to water was better than access to sanitation in all regions, and both of them improved between 2000 and 2020.

Firstly, for drinking water, Europe had the highest percentage in both years, 98% and 99%. Latin America was also high with 88% in 2000 and 96% in 2020. East Asia and South Asia was similar, they increased from 82% to 94% and from 80% to 92%. Sub-Saharan Africa was the lowest, only 46% in 2000, but it rose to 65% in 2020.

Secondly, the sanitation figures was lower. Europe had 92% and then 95%, and Latin America had 70% and 87%. In East Asia it improve from 55% to 83%. South Asia had a big increase, from 22% to 60%, it is the biggest change in the table. Sub-Saharan Africa had 23% in 2000 and 33% in 2020, so it was still the lowest in the end.

Band 7

203 words

Clear overview with the leading and lagging regions identified · data grouped effectively into ranges · good cohesion and collocation (lagged behind, provision) · frequent error-free sentences with minor awkwardness.

The table compares the proportion of people in five regions of the world who had access to safe drinking water and basic sanitation in 2000 and 2020.

Overall, access to both services improved in every region over the twenty years, although safe water was consistently more widely available than sanitation. Europe had the highest levels of provision, whereas Sub-Saharan Africa lagged far behind the other regions.

As regards drinking water, nearly all Europeans had access, with the figure rising from 98% to 99%. Latin America, East Asia and South Asia also had high levels, ranging from 80% to 88% in 2000 and increasing to between 92% and 96% in 2020. By contrast, fewer than half of the

population of Sub-Saharan Africa had safe water in 2000 (46%), although this improved to 65% by 2020.

Sanitation showed more significant differences. In Europe the figure was 92% in 2000 and 95% in 2020, while Latin America rose from 70% to 87%. The most dramatic improvements occurred in Asia: East Asia's rate went up from 55% to 83%, and South Asia's almost tripled from 22% to 60%. Sub-Saharan Africa, however, only rose by ten points to 33%, meaning two thirds of people still lacked basic sanitation.

Band 8

212 words

Precise overview · key contrasts selected skilfully with accurate derived differences · seamless cohesion and paragraphing · wide, natural vocabulary (outlier, near-universal coverage) · varied, accurate complex structures.

The table shows the percentage of the population in five world regions with access to safe drinking water and basic sanitation in 2000 and 2020.

It is evident that provision of both services expanded everywhere over the two decades, but access to sanitation remained lower than access to safe water in every region. Europe enjoyed near-universal coverage throughout, while Sub-Saharan Africa trailed well behind on both measures.

Safe water was already widely available in most regions in 2000, ranging from 80% in South Asia to 98% in Europe. By 2020, these four regions had all reached 92% or more, with Europe at 99%. Sub-Saharan Africa was the clear outlier: less than half its population (46%) had safe water at the start of the period, and although this rose by 19 percentage points, about a third of people still lacked access in 2020.

The gaps in sanitation were far wider. South Asia made the most striking progress, its coverage soaring from 22% to 60%, while East Asia also recorded a substantial rise of 28 points, reaching 83%. Latin America improved from 70% to 87%, and Europe from an already high 92% to 95%. In Sub-Saharan Africa, however, the figure increased only modestly, from 23% to 33%, leaving it the lowest in the table.

Energy use per person and renewable share, 2023

id wb1_table_08

The table below shows energy consumption per person and the share of energy from renewable sources in six countries in 2023.

Energy use per person and renewable share, 2023

Country	Energy use per person (GJ)	Renewable share (%)	Change in renewable share since 2013 (points)
Norway	210	61	+9
Canada	350	29	+3
Australia	225	14	+7
France	145	16	+5
Brazil	60	49	+8
Saudi Arabia	310	1	+1

Band 6

177 words

All three columns reported accurately · overview present but late and underdeveloped · each column described separately with repetitive verbs (used, had) · agreement and tense errors that do not block meaning.

The table shows how much energy people use in six countries in 2023 and what percentage of this energy come from renewable sources, and also how much the renewable share changed since 2013.

Canada used the most energy per person with 350 GJ, and Saudi Arabia was second with 310 GJ. Australia and Norway used 225 GJ and 210 GJ. France used less, 145 GJ, and Brazil used only 60 GJ, which is the lowest.

For renewable energy, Norway had the highest share with 61%, and Brazil was also high with 49%. Canada was 29%. However, Australia and France had quite low shares, 14% and 16%, and Saudi Arabia had only 1%, that is very low.

All the countries increased their renewable share since 2013. Norway increase the most by 9 points, and Brazil by 8 points and Australia by 7 points. France went up 5 points, Canada 3 points and Saudi Arabia only 1 point.

Overall, the countries which use a lot of energy does not always have a high renewable share, for example Saudi Arabia.

Band 7

205 words

Clear overview noting the lack of correlation · key features highlighted with useful comparisons · logical paragraphing · some less common vocabulary · mostly error-free, with a tense slip and slightly imprecise pairing.

The table provides information about energy consumption per person in six countries in 2023, along with the renewable share and how this changed over the previous decade.

Overall, energy use varied widely between the countries, and there was no clear link between the amount consumed and the renewable share. Norway and Brazil relied most heavily on renewables, while all six countries increased their renewable share since 2013.

Canada was the largest consumer of energy, at 350 GJ per person, followed by Saudi Arabia at 310 GJ. Australia and Norway had similar levels of consumption, at 225 GJ and 210 GJ respectively, while France used 145 GJ. Brazil's figure was by far the lowest, at just 60 GJ, which is less than a fifth of Canada's.

Regarding renewable energy, Norway had the highest share at 61%, after the largest increase of 9 points. Brazil came second with 49%, after an increase of 8 points. Canada's share was 29%, but it grew only 3 points. Australia and France had much lower proportions of 14% and 16%, although both of them improved by 7 and 5 points. Saudi Arabia, despite its high energy use, obtained only 1% from renewable sources and saw the smallest change of 1 point.

Band 8

212 words

Two-part overview captures the key relationships · figures selected and paired skilfully · cohesion and referencing managed well · precise vocabulary (diverged, per capita, a mere) · wide range of accurate structures.

The table compares six countries in terms of per capita energy consumption in 2023, the share of that energy derived from renewable sources, and the change in this share since 2013.

Two points stand out. First, levels of energy use bear little relation to reliance on renewables: some heavy consumers depend almost entirely on other sources, whereas relatively modest consumers make extensive use of renewable energy. Second, the renewable share rose in every country over the decade, although to very different degrees.

Canada and Saudi Arabia were the heaviest users, consuming 350 GJ and 310 GJ per person respectively, yet their renewable profiles diverged sharply. Canada obtained 29% of its energy from renewable sources, compared with a mere 1% in Saudi Arabia, where the share had grown by only a single point. Australia (225 GJ) and Norway (210 GJ) consumed similar amounts, but Norway's renewable share, at 61%, was more than four times Australia's 14%.

At the lower end of consumption, France used 145 GJ per person and sourced 16% of its energy from renewables. Brazil, whose consumption of 60 GJ was the lowest by a wide margin, had the second-highest renewable share at 49%. It was also, alongside Norway, among the fastest improvers, with gains of 8 and 9 points respectively.

Percentage of guests satisfied, by hotel

id wb1_table_09

The table below shows the results of a survey in which guests at three hotels were asked whether they were satisfied with five aspects of their stay.

Percentage of guests satisfied, by hotel

Aspect	Hotel Aurora	Harbour Inn	Parkside Lodge
Room cleanliness	94	81	88
Staff friendliness	86	90	72
Food quality	78	65	84
Value for money	61	88	79
Location	90	74	55

Band 6

173 words

All figures accurate and each hotel covered · overview basic and at the end · hotel-by-hotel listing limits comparison · simple, repetitive vocabulary · several agreement errors and comma splices that do not block meaning.

The table shows the results of a survey about how many guests was satisfied with five different aspects of their stay at three hotels.

Hotel Aurora got very good results for room cleanliness with 94%, which is the highest in the table, and location with 90%. Staff friendliness was 86% and food quality was 78%. But only 61% of guests thought that it was a good value for money.

Harbour Inn was the best hotel for staff friendliness, 90% of guests were satisfied. It also have the highest score for value for money, 88%. Room cleanliness was 81% and location was 74%. However, the food quality was not so good, only 65%.

Parkside Lodge had the best food with 84% and good cleanliness with 88%. Value for money was 79%. On the other hand, staff friendliness was 72% and location was only 55%, this was the lowest result of all.

Overall, each hotel was good in some aspects and bad in others, and Hotel Aurora seem to have the best results in general.

Band 7

195 words

Clear overview of contrasting strengths · key features for each hotel highlighted and compared · good range of linking (by contrast, nevertheless) · appropriate vocabulary · minor redundancy but mostly error-free.

The table presents the findings of a survey in which guests at three hotels were asked about their satisfaction with five aspects of their stay.

Overall, each hotel had its own strengths and weaknesses, and no single hotel performed best in every category. Hotel Aurora received the highest ratings in two areas, while Parkside Lodge had the lowest score of all for its location.

Hotel Aurora was rated most highly for room cleanliness, with 94% of guests satisfied, and for location, at 90%. Its staff were also well regarded (86%). However, only 61% felt that it offered value for money, which was the weakest result for this hotel and the lowest in that category.

Harbour Inn, by contrast, performed best in terms of value for money and staff friendliness, with satisfaction levels of 88% and 90% respectively. Its main weakness was food quality, which only 65% of guests were happy with. Parkside Lodge had the most positive rating for food, at 84%, and scored well for cleanliness (88%). Nevertheless, its staff received a less favourable rating of 72%, and just over half of its guests were satisfied with its location, which was 55%.

Band 8

205 words

Concise overview identifying each hotel's strength · figures selected skilfully with apt derived gap · cohesion smooth and varied · precise, idiomatic vocabulary (excelled, weak point) · wide range of accurate structures.

The table summarises the results of a survey in which guests at Hotel Aurora, Harbour Inn and Parkside Lodge indicated whether they were satisfied with five aspects of their stay.

Overall, satisfaction levels were generally high, but each hotel displayed a distinctive profile of strengths and weaknesses. Hotel Aurora excelled in cleanliness and location, Harbour Inn in value for money and staff, and Parkside Lodge in food, while the single poorest rating was for Parkside's location.

Hotel Aurora achieved the highest figures in the table for room cleanliness (94%) and location (90%), and its staff were also well regarded, with 86% of guests satisfied. Its clear weak point, however, was value for money: only 61% were satisfied, the lowest result in this category and 27 points below Harbour Inn.

Harbour Inn's guests were the most positive about staff friendliness (90%) and value (88%), yet food quality received the lowest rating of the three hotels, at 65%. Parkside Lodge, by contrast, led the way for food, with 84% satisfied, and also scored well for cleanliness (88%). Its staff, though, drew a comparatively modest 72%, and its location was the least popular aspect across all three hotels, satisfying barely more than half of guests (55%).

Quarterly unit sales, 2024 (thousands)

id wb1_table_10

The table below shows the quarterly sales of four products sold by a company in 2024.

Quarterly unit sales, 2024 (thousands)

Product	Q1	Q2	Q3	Q4	Year total
Product A	120	135	150	210	615
Product B	80	78	75	70	303
Product C	45	60	95	140	340
Product D	200	190	160	220	770
Total	445	463	480	640	2,028

Band 6

190 words

Overview present and figures accurate · every product covered but with too much mechanical detail and a trailing final paragraph · limited vocabulary · several verb-form and pronoun errors that do not block meaning.

The table shows the sales of four products of a company in each quarter of 2024 in thousands of units.

Overall, the sales of most products increased during the year and the fourth quarter was the best, with 640 thousand units in total. Product D sold the most in the year, 770 thousand.

Product D sold 200 thousand in Q1, but then the sales decreased to 190 and 160 thousand in Q2 and Q3. After that it went up again to 220 thousand in Q4. Product A increased every quarter, it started at 120 thousand and reached 210 thousand in Q4, and the total was 615 thousand.

Product C was the lowest in Q1 with only 45 thousand, but it grow very fast to 60, 95 and then 140 thousand, so the year total were 340 thousand. On the other hand, Product B was the only product which sales fell. It sold 80 thousand at first and then 78, 75 and 70 thousand in the last quarter. It total was 303 thousand, the lowest.

The total sales went up from 445 thousand in Q1 to 463, 480 and 640 thousand.

Band 7

202 words

Clear overview of the main trends and contrasts · key features well selected and logically sequenced · good range of cohesive devices · some less common collocations · frequent error-free sentences, slightly repetitive structure.

The table illustrates the number of units of four products (in thousands) that a company sold in each quarter of 2024 and the annual totals.

Overall, total sales increased throughout the year, with a particularly sharp rise in the final quarter. Product D was the best-selling item over the year, while Product C showed the fastest growth and Product B was the only one to decline.

The company's total sales grew gradually from 445 thousand units in Q1 to 480 thousand in Q3, before jumping to 640 thousand in Q4. Product D sold 200 thousand units in the first quarter

but saw a decrease to 160 thousand in Q3. However, it recovered strongly to 220 thousand in Q4, reaching a yearly total of 770 thousand. Product A followed a steadier upward trend, rising from 120 to 210 thousand units, and its annual sales amounted to 615 thousand.

The most dramatic change was in Product C, whose sales more than tripled from 45 to 140 thousand over the year. As a result, its total of 340 thousand was higher than that of Product B, which fell slightly in each quarter from 80 to 70 thousand and achieved the lowest total of 303 thousand.

Band 8

206 words

Well-placed overview contrasting growth and decline · data selected judiciously with accurate proportional change · cohesion managed skilfully · wide, precise trend vocabulary · varied complex structures, error-free.

The table sets out quarterly sales figures, in thousands of units, for four products sold by a company in 2024, together with their totals for the year.

Overall, the company's combined sales rose in every quarter, surging in the last three months of the year. Product D was the top seller over the year, but the most striking trend was the rapid expansion of Product C, in contrast to the gradual decline of Product B.

Combined sales edged up from 445 thousand in Q1 to 480 thousand in Q3, before leaping by a third to 640 thousand in Q4. Product D accounted for the largest share of annual sales, at 770 thousand units, although its performance was uneven: sales slipped from 200 to 160 thousand between Q1 and Q3 before rebounding to 220 thousand. Product A, meanwhile, grew in each quarter, from 120 to 210 thousand, for a total of 615 thousand.

Product C began the year as the weakest performer, at just 45 thousand, yet its sales rose more than threefold to 140 thousand by Q4, lifting its annual total to 340 thousand. Product B, by contrast, recorded a steady fall from 80 to 70 thousand, leaving it with the lowest total of 303 thousand.

Population, area and density of six cities

id wb1_table_11

The table below gives information about the population, land area and population density of six major cities.

Population, area and density of six cities

City	Population (millions)	Area (km ²)	Density (people per km ²)
Lagos	15.4	1,171	13,151
Cairo	10.2	3,085	3,306
Mumbai	12.5	603	20,730
Tokyo	14.0	2,194	6,381
Toronto	2.8	630	4,444
Lima	10.0	2,672	3,743

Band 6

178 words

Accurate figures for all three measures · brief overview at the end · columns described separately with little link between area and density · tense, article and agreement errors that do not block meaning.

The table gives information about six big cities and it shows their population, area and population density.

Lagos had the biggest population with 15.4 million people, and Tokyo was next with 14.0 million. Mumbai had 12.5 million, while Cairo and Lima had 10.2 million and 10.0 million. Toronto was much smaller than the other cities, only 2.8 million people live there.

Looking at area, Cairo is the largest city with 3,085 km², and Lima and Tokyo are also big with 2,672 km² and 2,194 km². Lagos has 1,171 km², which is in the middle. Mumbai and Toronto are the smallest cities, 603 km² and 630 km².

About density, Mumbai is the most crowded city because it has 20,730 people per km². Lagos is second with 13,151. Tokyo has 6,381 and Toronto has 4,444. Lima and Cairo have the lowest density, 3,743 and 3,306 people per km².

Overall, Mumbai is the most dense city although it has small area, and Lagos have the most people.

Band 7

199 words

Clear overview of the main extremes · link between area and density highlighted · logical progression · good range of vocabulary (populous, occupied) · frequent error-free sentences with slight overuse of respectively.

The table compares six major cities in terms of their population, land area and population density.

Overall, there were considerable differences between the cities. Lagos had the largest population, whereas Mumbai was by far the most densely populated city, because of its relatively small area. Toronto had the fewest inhabitants, while Cairo covered the largest area and had the lowest density.

With 15.4 million residents, Lagos was the most populous city, followed by Tokyo with 14.0 million and Mumbai with 12.5 million. Cairo and Lima had similar populations, at 10.2 million and 10.0 million respectively, while Toronto was much smaller at 2.8 million.

In terms of area, Cairo was the largest city at 3,085 km², followed by Lima (2,672 km²) and Tokyo (2,194 km²). Mumbai and Toronto occupied the smallest areas, at 603 km² and 630 km² respectively. Consequently, Mumbai had an exceptionally high density of 20,730 people per km², and Lagos also had a high figure of 13,151. In contrast, Tokyo's density was much lower at 6,381, despite its large population, and the remaining three cities had the lowest densities, ranging from 3,306 in Cairo to 4,444 in Toronto.

Band 8

217 words

Insightful overview linking density to area · features synthesised across columns with an accurate ratio · cohesion managed effortlessly · precise vocabulary (compact, populous) · wide range of structures, error-free.

The table provides data on the population, land area and population density of six large cities.

The most striking feature is the variation in density, which depends as much on land area as on population size. Mumbai is by far the most crowded city despite occupying the smallest area, while Cairo, the largest city by area, is the least densely populated.

Lagos has the largest population, at 15.4 million, and because its area is a relatively compact 1,171 km², it has the second-highest density, at 13,151 people per km². Mumbai, with 12.5 million inhabitants living in just 603 km², is even more densely populated, with 20,730 people per km², more than six times the figure for Cairo.

Tokyo presents a contrasting case. Although its population of 14.0 million is the second largest, it is spread over 2,194 km², giving a moderate density of 6,381. Cairo and Lima, each with around ten million residents, cover the largest areas, at 3,085 km² and 2,672 km², so their densities are the lowest, at 3,306 and 3,743 respectively. Toronto is the smallest city by population, at only 2.8 million, but its limited area of 630 km² results in a density of 4,444, slightly higher than those of Cairo and Lima.

Households owning selected appliances (%)

id wb1_table_12

The table below shows the percentage of households in one country that owned five household appliances in 1970, 1990, 2010 and 2020.

Households owning selected appliances (%)

Appliance	1970	1990	2010	2020
Refrigerator	58	96	99	99
Washing machine	64	87	96	97
Dishwasher	3	14	40	49
Microwave oven	0	47	92	93
Tumble dryer	1	45	57	55

Band 6

166 words

Accurate figures organised chronologically · overview present but basic and placed last · repetitive trend language (went up, increased) · several agreement, tense and article errors that do not impede meaning.

The table shows the percentage of households in one country which had five different household appliances in 1970, 1990, 2010 and 2020.

In 1970, refrigerator and washing machine was the most common appliances, with 58% and 64% of households. Very few households had a dishwasher (3%) or a tumble dryer (1%), and nobody had a microwave oven.

By 1990, the numbers went up a lot. Refrigerators increased to 96% and washing machines to 87%. Microwave ovens increase to 47% and tumble dryers to 45%, but dishwashers was still low with 14%.

In 2010 and 2020, refrigerators and washing machines was almost in every home, 99% and 97% in 2020. Microwave ovens also became very common, 92% in 2010 and 93% in 2020. Dishwashers rose to 40% and then 49%. However, tumble dryers went up to 57% in 2010 but after that it decreased a little to 55%.

Overall, the ownership of all appliances increased a lot over the period, and microwave oven had the biggest growth.

Band 7

199 words

Clear overview of near-universal and slower-growing items · appliances grouped logically · good lexical range (non-existent, virtually) · mostly accurate grammar with a minor tense slip at the end.

The table illustrates the proportion of households in one country that owned a refrigerator, a washing machine, a dishwasher, a microwave oven and a tumble dryer at four points between 1970 and 2020.

Overall, ownership of all five appliances rose over the fifty-year period, although the pace of growth varied. Refrigerators and washing machines became almost universal, while microwave ovens experienced the most rapid increase. Dishwashers, however, remained the least common appliance.

In 1970, washing machines were the most widely owned appliance, found in 64% of homes, slightly more than refrigerators at 58%. Both became increasingly common over the following decades, and by 2020 virtually every household had a fridge (99%) and 97% had a washing machine.

Microwave ovens showed the most remarkable growth. Non-existent in homes in 1970, they were owned by 47% of households by 1990, 92% in 2010 and 93% in 2020. Tumble dryers also spread quickly at first, rising from just 1% to 45% by 1990 and 57% in 2010, but this figure fell slightly to 55% in the final year. Dishwashers grew more steadily, from 3% to 40% in 2010, and reached 49% in 2020, meaning that fewer than half of households own one.

Band 8

186 words

Clear overview dividing common and less widespread appliances · key trends and the one reversal selected skilfully · cohesion effortless · precise vocabulary (plateaued, dipping) · wide range of accurate structures.

The table charts the percentage of households in one country owning five household appliances in 1970, 1990, 2010 and 2020.

Ownership of every appliance was considerably higher in 2020 than in 1970, with the sharpest growth occurring between 1970 and 2010. By the end of the period, refrigerators, washing machines and microwave ovens were found in almost every home, whereas dishwashers and tumble dryers remained far less widespread.

Refrigerators and washing machines were already fairly common in 1970, owned by 58% and 64% of households respectively. Refrigerator ownership rose to 96% within twenty years and plateaued at 99% from 2010, while washing machines followed a more gradual path to 97%.

The microwave oven underwent the most dramatic transformation, from being absent from homes entirely in 1970 to featuring in almost half (47%) by 1990 and 93% by 2020. Tumble dryers were similarly rare at first, at 1%, and climbed to 57% in 2010, but they were the only appliance to decline thereafter, dipping to 55%. Dishwasher ownership, meanwhile, rose steadily from a mere 3% but still stood at just under half (49%) in the final year.

Country F	2	3	8	11

Band 6

178 words

Relevant overview and accurate figures · doctors and nurses covered separately in a list-like way · linking mechanical · adequate but repetitive vocabulary · agreement and tense errors plus a comma splice, meaning still clear.

The table shows how many doctors and nurses there was for every 10,000 people in six countries in 2010 and 2022.

Overall, most countries had more doctors and nurses in 2022 than in 2010, and in all countries there were more nurses than doctors.

Country A had the most doctors, 38 in 2010 and 45 in 2022. Country E was also high, it increased from 33 to 41. Country B had 26 and 28 doctors. On the other hand, Country C, D and F had few doctors. Country C rose from 11 to 19, Country D from 6 to 9 and Country F had only 2 and then 3.

For nurses, Country A was again the highest with 110 in 2010 and 118 in 2022. Country E increased a lot from 79 to 104. Country B was the only country where the number of nurses go down, from 85 to 81. Country C and Country D also increase, from 25 to 40 and 14 to 30. Country F was the lowest again with 8 and 11 nurses.

Band 7

202 words

Clear overview of the doctor-nurse gap and extremes · key changes highlighted, including the one decline · good cohesion and some less common vocabulary · mostly error-free with a missing article.

The table compares the number of doctors and nurses per 10,000 people in six countries in 2010 and 2022.

Overall, nurses outnumbered doctors in every country in both years, and the provision of health workers generally improved over the period. Country A had the highest ratios and Country F the lowest.

In terms of doctors, Country A led in both years, with the figure rising from 38 to 45, followed closely by Country E, which went from 33 to 41. Country B's figure increased only slightly from

26 to 28. The other three countries had much lower ratios: Country C improved from 11 to 19, while Country D and Country F had fewer than ten doctors per 10,000 people in both years.

The number of nurses was considerably higher. Country A again had the most, at 110 in 2010 and 118 in 2022, while Country E saw the biggest increase, from 79 to 104. Country B was the only country where the ratio of nurses declined, falling from 85 to 81. Meanwhile, the figure for Country D more than doubled from 14 to 30, and Country C also rose significantly to 40, although Country F remained lowest, with just 11.

210 words

Clear two-part overview · countries grouped by level of provision with key contrasts selected · cohesion managed skilfully · precise vocabulary (absolute gain, best-provided) · wide range of structures, error-free.

The table presents the number of doctors and nurses per 10,000 people in six countries, comparing figures for 2010 and 2022.

Two features are immediately apparent: nurses outnumbered doctors in every country in both years, and staffing levels improved almost everywhere over the period. There was, however, a striking gap between the best-provided countries, A and E, and the least well-provided, D and F.

Country A had the highest density of both professions, with doctors increasing from 38 to 45 and nurses from 110 to 118. Country E, although slightly behind, recorded the largest absolute gain in nurses, a rise of 25 to reach 104. Country B, by contrast, saw almost no change in its doctor ratio (26 to 28), and it was the only country in which nurse numbers fell, from 85 to 81.

At the lower end, Country C made notable progress, with its doctor ratio climbing from 11 to 19 and its nurse ratio from 25 to 40. Country D more than doubled its nurses from 14 to 30, although it still had only 9 doctors per 10,000 people in 2022. Country F remained far behind the rest, with just 3 doctors and 11 nurses per 10,000 people by the end of the period.

Average daily media use by age group, 2024 (minutes)

id wb1_table_14

The table below shows the average number of minutes per day that people in four age groups in one country spent using different types of media in 2024.

Average daily media use by age group, 2024 (minutes)				
Media type	16-24	25-44	45-64	65+
Broadcast TV	25	70	155	270
Video streaming	185	120	60	20
Social media	160	95	45	15
Radio / podcasts	40	75	90	110
Printed newspapers	2	6	18	42

Band 6

186 words

Accurate data with a basic overview at the end · organised by age group so comparison is limited · simple, repetitive vocabulary · agreement, tense and word-order errors that do not block meaning.

The table shows how many minutes people in four age groups spent on different media each day in one country in 2024.

Firstly, young people aged 16–24 spent the most time on video streaming, 185 minutes, and social media, 160 minutes. They only watched broadcast TV for 25 minutes and they listen to radio or podcasts for 40 minutes. They almost didn't read printed newspapers, only 2 minutes.

The 25–44 group used video streaming for 120 minutes and social media for 95 minutes. They spent 70 minutes on TV and 75 minutes on radio or podcasts, and newspapers was 6 minutes.

However, older people was very different. People aged 45–64 watched TV for 155 minutes and the 65+ group watched 270 minutes, it is the highest number in the table. They also listened more to radio or podcasts, 90 and 110 minutes, and read more newspapers, 18 and 42 minutes. But they used less streaming and social media, for example the oldest group spent only 20 and 15 minutes.

Overall, young people prefer new media and older people prefer traditional media like TV.

Band 7

204 words

Clear overview of the generational divide · trends across age groups presented logically · good range of cohesive devices · some less common vocabulary (favoured, medium) · frequent error-free sentences, one slightly awkward phrase.

The table illustrates the average amount of time that people in four age groups in one country spent each day using five types of media in 2024.

Overall, there was a clear generational divide. Younger people spent most of their media time on video streaming and social media, while older age groups favoured more traditional media, particularly broadcast TV.

Among 16- to 24-year-olds, video streaming was the most popular activity, at 185 minutes a day, closely followed by social media at 160 minutes. Time spent on these two media declined

steadily with age, falling to just 20 and 15 minutes respectively for those aged 65 and over. These were also the main media for the 25–44 age group, at 120 and 95 minutes.

The opposite trend can be seen for broadcast TV, radio and newspapers. Viewing of broadcast TV rose dramatically from only 25 minutes among the youngest group to 270 minutes, or four and a half hours, among the over-65s. Similarly, time spent listening to radio or podcasts increased from 40 to 110 minutes across the age groups. Printed newspapers were the least used medium overall, although reading time grew from 2 minutes for the youngest to 42 minutes for the oldest.

Band 8

214 words

Perceptive overview of opposing age trends · data selected and compared skilfully with an accurate multiple · cohesion natural and well controlled · precise vocabulary (negligible, devotes) · wide range of accurate structures.

The table compares the average daily time spent on five forms of media by four age groups in one country in 2024.

The dominant pattern is a sharp contrast between generations: streaming and social media account for most of young people's media time, whereas broadcast TV, radio and print become steadily more important with age. The oldest group spends more time on broadcast TV than any group spends on any other single medium.

The 16–24 age group devotes 185 minutes a day to video streaming and 160 minutes to social media, but only 25 minutes to broadcast TV and a negligible 2 minutes to newspapers. For those aged 25–44, streaming still leads at 120 minutes, but use is more evenly spread across social media (95), radio or podcasts (75) and TV (70).

Among older people, the picture is reversed. Broadcast TV accounts for 155 minutes a day among 45- to 64-year-olds and a remarkable 270 minutes among the over-65s, more than ten times the figure for the youngest group. Radio and podcasts follow the same upward trend, peaking at 110 minutes, as do printed newspapers, which occupy 42 minutes of the oldest group's day. In contrast, streaming and social media fall to just 20 and 15 minutes respectively for this group.

New titles published by genre

id wb1_table_15

The table below shows the number of new books published in one country in six genres in 2004, 2014 and 2024.

New titles published by genre			
Genre	2004	2014	2024
Fiction	11,200	14,800	17,900
Children's	6,500	8,900	10,100
Biography	2,900	3,100	2,600
Science & technology	4,800	4,200	3,900
Travel	2,100	1,500	900
Self-help	1,300	3,400	5,800

Band 6

185 words

Accurate figures with rising and falling genres grouped · overview basic and placed at the end · limited, repetitive trend vocabulary · agreement and verb-form errors that do not impede meaning.

The table shows the number of new books which was published in six different genres in one country in 2004, 2014 and 2024.

Fiction was the most popular genre in all three years. It increased from 11,200 books in 2004 to 14,800 in 2014 and 17,900 in 2024. Children's books was the second, and they also went up from 6,500 to 8,900 and then 10,100.

Self-help books increased very fast. In 2004 there were only 1,300 books but it rose to 3,400 in 2014 and 5,800 in 2024, so it became the third biggest genre at the end.

On the other hand, some genres decreased. Science and technology books fell from 4,800 to 4,200 and 3,900. Travel books had the biggest fall, from 2,100 to 1,500 and only 900 in 2024. Biography was a bit different, because it rose from 2,900 to 3,100 in 2014 but then it drop to 2,600 in 2024.

Overall, fiction, children's and self-help books was increasing, but travel and science books was decreasing.

Band 7

194 words

Clear overview of growing and shrinking genres · key features highlighted with accurate multiples · logical paragraphing · good range of trend vocabulary · mostly error-free, with one clumsy noun phrase.

The table illustrates how many new titles were published in six genres in one country in 2004, 2014 and 2024.

Overall, fiction was by far the largest genre throughout the period, and it grew considerably, as did children's books and self-help. By contrast, the number of new travel and science and technology titles declined, while biography remained relatively stable.

Fiction titles rose steadily from 11,200 in 2004 to 14,800 in 2014, reaching 17,900 in 2024. Children's books followed a similar upward trend, increasing from 6,500 to 10,100 over the

twenty years. However, the most remarkable growth was seen in self-help books, which more than quadrupled from just 1,300 to 5,800, making self-help the third largest genre by the end of the period.

In contrast, the number of science and technology titles fell gradually from 4,800 to 3,900. Travel saw the sharpest decline, with new publications dropping from 2,100 to 1,500 in 2014 and to just 900 in 2024, less than half the original figure. The figures for biography fluctuated slightly, rising from 2,900 to 3,100 before falling back to 2,600.

Band 8

202 words

Clear overview of diverging trends · key features skilfully selected, including changes in rank · cohesion seamless · wide, precise vocabulary (consolidating, contracted) · wide range of structures, error-free.

The table shows the number of new books published in six genres in one country at ten-year intervals between 2004 and 2024.

The most notable trend is the divergence between genres: fiction, children's books and self-help all expanded markedly, whereas output of science and technology and travel titles contracted. Fiction remained the dominant genre throughout, while self-help recorded by far the fastest growth.

New fiction titles increased by 6,700 over the two decades, from 11,200 to 17,900, consolidating their leading position. Children's books, the second largest category, also rose substantially, from 6,500 to 10,100. Most striking of all, however, was the surge in self-help publishing: from a modest 1,300 titles in 2004, the smallest figure in the table, output climbed to 3,400 in 2014 and 5,800 in 2024, overtaking first biography and then science and technology.

The remaining genres moved in the opposite direction. Science and technology titles fell steadily from 4,800 to 3,900, while travel publishing more than halved, sinking from 2,100 to just 900. Biography was the only genre to fluctuate, edging up from 2,900 to 3,100 before slipping to 2,600, slightly below its starting level.

Climate data for Port Sella (monthly averages)

id wb1_table_16

The table below shows the average monthly temperature, rainfall and hours of sunshine in one city.

Climate data for Port Sella (monthly averages)

Month	Temperature (°C)	Rainfall (mm)	Sunshine (hours/day)
January	11	98	4.5
February	12	84	5.2
March	14	62	6.3
April	16	45	7.8
May	20	22	9.4
June	24	6	11.0
July	27	1	11.8
August	27	3	10.9
September	24	18	8.7
October	20	58	6.6
November	15	92	5.0
December	12	110	4.2

Band 6

184 words

All three variables covered accurately · overview relevant but placed at the end · each variable described separately with simple linking · several verb-agreement and word-choice errors that do not block meaning.

The table shows the average temperature, rainfall and sunshine hours for each month in a city called Port Sella.

Firstly, the temperature is lowest in January with 11°C and it goes up every month until July and August, when it reach 27°C. After that it goes down again to 20°C in October and 12°C in December.

Rainfall is very different. The wettest month is December with 110 mm, and January and November also have a lot of rain, 98 mm and 92 mm. From February the rain decrease, and in summer there is almost no rain, only 6 mm in June, 1 mm in July and 3 mm in August. Then it increases again in the autumn, for example 58 mm in October.

Sunshine is similar like the temperature. In December there is only 4.2 hours a day and in January 4.5 hours, but in July there is 11.8 hours, which is the most sunny month. June and August have 11.0 and 10.9 hours.

Overall, Port Sella has hot, dry and sunny summers and cool, wet winters with less sunshine.

Band 7

199 words

Clear overview of the seasonal pattern · temperature and sunshine logically combined · good cohesion and trend language · appropriate vocabulary · mostly accurate, though some approximation and slight repetition of month.

The table gives the average monthly temperature, rainfall and daily hours of sunshine in Port Sella over the course of a year.

Overall, the city has warm, dry and sunny summers, while its winters are cooler, wetter and much less sunny. Rainfall generally moves in the opposite direction to temperature and sunshine.

Temperatures are lowest in January, at 11°C, and rise steadily through spring to reach a peak of 27°C in July and August. They then fall again in autumn, dropping to 20°C in October and 12°C by December. Sunshine follows a very similar pattern, increasing from around four and a half hours a day in winter to a maximum of 11.8 hours in July, before declining to 4.2 hours in December, the least sunny month.

Rainfall, by contrast, is heaviest in the winter months. December is the wettest month, with 110 mm, followed by January (98 mm) and November (92 mm). From February onwards, the amount of rain falls considerably, and the summer is extremely dry, with only 6 mm in June, 1 mm in July and 3 mm in August. The rain then returns in autumn, rising to 58 mm in October.

Band 8

197 words

Well-placed overview explaining how the variables relate · figures selected purposefully with accurate derived comparisons · cohesion effortless · precise vocabulary (mirror, precipitation) · wide range of structures, error-free.

The table provides monthly averages for temperature, rainfall and daily sunshine in the city of Port Sella.

The data show a pronounced seasonal pattern, with hot, sunny and almost completely dry summers contrasting with mild, wet winters that receive considerably less sunshine.

Temperature and sunshine rise and fall together, whereas rainfall follows the reverse pattern.

Temperatures climb gradually from a low of 11°C in January to a peak of 27°C in both July and August, a difference of 16 degrees, before falling back to 12°C in December. Hours of sunshine mirror this trend closely: the city receives only 4.5 hours a day in January and 4.2 in December, but almost three times as much in midsummer, when the figure reaches 11.8 hours in July.

Rainfall, in contrast, is concentrated in the cooler months. December is the wettest month, with 110 mm, and November and January are almost as wet, at 92 mm and 98 mm respectively. Precipitation then declines sharply through spring, to 22 mm in May, and virtually disappears in summer, with July recording just 1 mm. The rains return from September, when 18 mm falls, rising steeply to 58 mm in October.

Prices of everyday items, 2024 (US\$)

id wb1_table_17

The table below shows the prices of six everyday items in five cities in 2024 (in US dollars).

Prices of everyday items, 2024 (US\$)

Item	City A	City B	City C	City D	City E
Cup of coffee	5.20	2.10	3.80	1.40	4.60
Loaf of bread	3.90	1.20	2.60	0.90	3.10
Cinema ticket	16.00	6.50	11.00	4.00	14.50
Monthly transport pass	132.00	28.00	85.00	19.00	60.00
Litre of petrol	1.60	1.05	1.85	0.75	2.10
Restaurant meal	28.00	9.00	19.00	6.50	24.00

Band 6

179 words

Clear but simple overview · accurate prices organised city by city with limited comparison · repetitive structures (is, costs) · verb agreement errors and a comma splice that do not affect understanding.

The table shows the prices of six everyday items in five cities in 2024, and the prices are in US dollars.

Overall, City A is the most expensive city for most of the items and City D is the cheapest for all of them.

In City A, a cup of coffee costs \$5.20 and a loaf of bread costs \$3.90. A cinema ticket is \$16.00 and a restaurant meal is \$28.00, which are the highest prices. The monthly transport pass is very expensive, \$132.00. City E is also expensive, for example a restaurant meal cost \$24.00 and a cinema ticket cost \$14.50. Petrol in City E is \$2.10, it is the most expensive petrol.

City C is in the middle with \$3.80 for coffee and \$85.00 for a transport pass. On the other hand, City B and City D is much cheaper. In City D a coffee is only \$1.40, bread is \$0.90 and a transport pass is \$19.00. City B is a little more expensive than City D, for example coffee is \$2.10 and a meal is \$9.00.

Band 7

202 words

Clear overview identifying the dearest and cheapest cities · key contrasts highlighted, including the petrol exception · logical progression · good range of comparative structures · mostly error-free with some repetition of cost.

The table compares the cost of six common items, in US dollars, in five different cities in 2024.

Overall, City A was the most expensive place for most items, while City D was the cheapest for every item. City E and City C also had relatively high prices, whereas prices in City B were generally low.

The largest difference between the cities was in the price of a monthly transport pass, which cost \$132.00 in City A, about seven times as much as in City D (\$19.00). This pass was also expensive in City C, at \$85.00, but it cost only \$28.00 in City B. Similarly, a restaurant meal in

City A cost \$28.00, compared with just \$6.50 in City D, and a cinema ticket was \$16.00 in City A but only \$4.00 in City D.

Smaller items showed the same pattern. A cup of coffee cost \$5.20 in City A and \$4.60 in City E, whereas in City B and City D it cost \$2.10 and \$1.40 respectively. The only exception to City A's high prices was petrol, which was most expensive in City E, at \$2.10 a litre, and in City C (\$1.85), while City A's price was \$1.60.

Band 8

210 words

Well-judged overview including the one exception · figures selected selectively with accurate ratios · cohesion managed skilfully · precise vocabulary (dearest, intermediate, fourfold) · wide range of accurate structures.

The table shows how much six everyday goods and services cost in five cities in 2024, with all prices given in US dollars.

It is clear that City A was the most expensive of the five cities for nearly every item, whereas City D was consistently the cheapest. Petrol was the only item that did not follow this pattern, being dearest in City E.

The gap between the most and least expensive cities was widest for the monthly transport pass, which cost \$132.00 in City A but just \$19.00 in City D, roughly a seventh of the price. City C and City E occupied an intermediate position, at \$85.00 and \$60.00 respectively, while City B's pass was relatively affordable at \$28.00. Leisure costs followed a similar pattern: a restaurant meal ranged from \$28.00 in City A to \$6.50 in City D, and a cinema ticket from \$16.00 to \$4.00, a fourfold difference.

For everyday purchases, the differences were smaller in absolute terms but still considerable. Coffee cost \$5.20 in City A, almost four times the \$1.40 charged in City D, and bread \$3.90 compared with \$0.90. Petrol, however, was priced highest in City E at \$2.10 and City C at \$1.85, with City A's figure of \$1.60 only third highest.

Attendance at cultural events at least once in 2023 (%)

id wb1_table_18

The table below shows the percentage of people in different age groups who attended four types of cultural event at least once in 2023.

Attendance at cultural events at least once in 2023 (%)

Age group	Theatre	Cinema	Live music concert	Museum or gallery
16–24	18	82	57	34
25–34	22	74	49	41
35–54	29	61	31	45
55–74	36	44	22	52
75+	24	20	8	28

Band 6

175 words

Accurate figures and sensible grouping of events · overview relevant but placed at the end · mechanical description of each event · agreement, tense and article errors that do not block meaning.

The table shows the percentage of people in five age groups who went to four kinds of cultural events at least one time in 2023.

Cinema was the most popular event for young people. 82% of people aged 16–24 went to the cinema, and it was 74% for 25–34 and 61% for 35–54. But it decrease for older people, to 44% for 55–74 and only 20% for people over 75.

Live music concert was similar. The youngest group had 57% and then the percentage go down to 49%, 31%, 22% and just 8% for the oldest group.

On the other hand, theatre and museums was more popular with older people. Theatre went up from 18% for the youngest to 36% for 55–74, but it fell to 24% for 75+. Museum or gallery also increased from 34% to 52% and then dropped to 28%.

Overall, young people like cinema and concerts more, and older people like theatre and museum more, but the oldest group go to less events in general.

Band 7

204 words

Clear overview of opposing age trends · key features and peaks highlighted · logical paragraphing and good linking · appropriate range of vocabulary · frequent error-free sentences with a minor collocation slip.

The table illustrates the proportion of people in five age groups who went to the theatre, the cinema, a live music concert or a museum or gallery at least once in 2023.

Overall, attendance at cinemas and live music concerts fell steadily with age, whereas theatre and museum visits became more popular until the 55–74 age group. People aged 75 and over had the lowest participation in most types of event.

The cinema was the most popular cultural activity among younger adults, attracting 82% of 16–to 24-year-olds. This figure dropped gradually to 61% for those aged 35–54 and to just 20% among the oldest group. Live music concerts showed an even sharper decline, from 57% of the

youngest age group to only 8% of those aged 75+.

In contrast, the proportion of people visiting museums or galleries increased from 34% among 16–24s to a peak of 52% among 55- to 74-year-olds, making it the most popular activity for this group. Theatre attendance followed a similar trend, rising from 18% to 36%. However, both activities became less common among the over-75s, with figures of 28% and 24% respectively, although museums were still the most visited event for this age group.

Band 8

207 words

Insightful overview of diverging patterns and the oldest group · figures chosen skilfully with accurate derived comparisons · seamless cohesion · precise vocabulary (diminished, progressively) · wide range of structures, error-free.

The table shows the percentage of people in five age brackets who attended a theatre, a cinema, a live music concert or a museum or gallery at least once in 2023.

Age clearly shaped cultural preferences. Cinema-going and concert attendance declined consistently as people got older, whereas the theatre and museums gained in popularity up to the 55–74 group before falling back among the over-75s, who were the least active group overall.

The cinema was the most widely attended event for all groups under 55, drawing 82% of 16- to 24-year-olds, but its appeal diminished steadily with age, to 44% of those aged 55–74 and only 20% of those aged 75 and above. Live music followed an even steeper downward path: while more than half of the youngest group (57%) went to a concert, only 8% of the oldest did so, a seventh of the figure.

Museums and galleries, by contrast, became progressively more popular with age, rising from 34% of the youngest group to 52% of 55- to 74-year-olds, at which point they overtook the cinema as the most popular activity. Theatre attendance doubled over the same age range, from 18% to 36%. Among the over-75s, however, both declined, to 28% and 24% respectively.

Machinery	18.4	27.9	+52%
Vehicles	22.1	19.6	-11%
Pharmaceuticals	6.3	16.8	+167%
Textiles	11.7	8.2	-30%
Food products	9.8	14.1	+44%
Total	68.3	86.6	+27%

Band 6 167 words

Overview present and all figures accurate · key changes identified but described mechanically · repetitive vocabulary (biggest, went up) · agreement errors, a comma splice and a verb-form error that do not block meaning.

The table shows the value of five kinds of goods which one country exported in 2010 and 2024, in billions of US dollars.

Overall, the total value of exports increased from \$68.3 billion to \$86.6 billion, which is a rise of 27%. Most categories went up but two categories went down.

In 2010, vehicles was the biggest export with \$22.1 billion, and machinery was second with \$18.4 billion. However, in 2024 machinery became the biggest with \$27.9 billion, it increased by 52%. Vehicles fell to \$19.6 billion, a decrease of 11%.

Pharmaceuticals had the biggest growth. The value was only \$6.3 billion in 2010 but it rise to \$16.8 billion in 2024, so the change was 167%. Food products also grew from \$9.8 billion to \$14.1 billion, which is 44% more.

On the other hand, textiles decreased the most. In 2010 it were \$11.7 billion, but in 2024 it was only \$8.2 billion, a fall of 30%, and it became the smallest category of exports in 2024.

Band 7 182 words

Clear overview of overall growth and contrasting categories · changes in ranking highlighted · logical organisation · good range of vocabulary and linking · mostly error-free with slight repetition of category.

The table illustrates the value of a country's exports in five categories of goods in 2010 and 2024, together with the percentage change over this period.

Overall, the country's total exports grew significantly, rising by 27% from \$68.3 billion to \$86.6 billion. While three categories expanded, with pharmaceuticals experiencing by far the fastest growth, exports of vehicles and textiles declined.

In 2010, vehicles were the country's most valuable export, worth \$22.1 billion, followed by machinery at \$18.4 billion. By 2024, however, their positions had reversed, as machinery

exports climbed by 52% to \$27.9 billion, while vehicle exports decreased by 11% to \$19.6 billion.

The most dramatic change was seen in pharmaceuticals, whose value rose from only \$6.3 billion to \$16.8 billion, an increase of 167%. As a result, pharmaceuticals overtook textiles and food products to become the third largest category. Food products also performed well, growing by 44% from \$9.8 billion to \$14.1 billion. Textiles, in contrast, saw the steepest fall of any category, dropping by 30% from \$11.7 billion to \$8.2 billion, which made it the smallest export category in 2024.

Band 8

197 words

Clear overview capturing the change of leader and contrasting trends · absolute and relative changes integrated accurately · cohesion well managed · precise vocabulary · wide range of structures, error-free.

The table compares the value, in billions of US dollars, of five categories of goods exported by one country in 2010 and 2024, alongside the percentage change in each.

Although the country's export earnings rose substantially overall, the categories performed very differently. Machinery replaced vehicles as the leading export, pharmaceuticals grew at a remarkable rate, and textiles and vehicles were the only categories to shrink.

Total exports increased by 27%, from \$68.3 billion to \$86.6 billion. Machinery expanded by \$9.5 billion, or 52%, to reach \$27.9 billion. Vehicles, by contrast, had been the most valuable category in 2010, at \$22.1 billion, but their value fell by 11% to \$19.6 billion, pushing them into second place.

Pharmaceuticals recorded the most spectacular growth, with exports rising by 167%, from \$6.3 billion to \$16.8 billion. This gain of \$10.5 billion, the largest of any category in absolute terms as well, lifted the sector from the smallest category to the third largest. Food products also grew steadily, by 44%, to \$14.1 billion. Textiles, however, suffered the sharpest decline, losing almost a third of their value as exports dropped from \$11.7 billion to \$8.2 billion, leaving them the smallest category by 2024.

Employment in technology occupations by sex, 2024 (thousands)

id wb1_table_20

The table below shows the number of men and women employed in five technology occupations in one country in 2024.

Employment in technology occupations by sex, 2024 (thousands)

Occupation	Men	Women	Women as % of total
Software developers	412	98	19%
Data analysts	96	71	43%
IT support technicians	188	44	19%
Web & UX designers	57	49	46%
Cyber-security specialists	73	16	18%

Band 6 182 words

Relevant overview and accurate figures · occupations sensibly grouped but described mechanically · unnecessary concluding sentence · repetitive vocabulary · agreement errors and a comma splice that do not impede meaning.

The table shows how many men and women worked in five technology jobs in one country in 2024, and also the percentage of women in each job.

Overall, there were more men than women in all of the occupations, but in some jobs the difference were much smaller.

Software developers was the biggest occupation. There were 412 thousand men but only 98 thousand women, so women were just 19% of the total. IT support technicians was similar, with 188 thousand men and 44 thousand women, which is also 19%. Cyber-security specialists had the lowest percentage of women, only 18%, there were 73 thousand men and 16 thousand women.

On the other hand, data analysts and web and UX designers had more balance between men and women. In data analysts there were 96 thousand men and 71 thousand women, so women was 43%. Web and UX designers had 57 thousand men and 49 thousand women, and the percentage of women was 46%, which is the highest in the table.

In conclusion, men are the majority in technology jobs, especially in software and cyber-security.

Band 7 193 words

Clear overview contrasting the two groups of occupations · key features highlighted with apt comparisons · logical paragraphing · good range of vocabulary · mostly error-free, with some repetitive phrasing.

The table compares the number of men and women working in five technology occupations in one country in 2024, and shows women's share of the total workforce in each.

Overall, men outnumbered women in every occupation. However, the gender gap was much narrower among data analysts and web and UX designers than in the other three jobs, where

women made up less than a fifth of the workforce.

Software development was by far the largest occupation, employing 412 thousand men and just 98 thousand women, so women accounted for only 19% of software developers. The picture was similar for IT support technicians, with 188 thousand men compared with 44 thousand women, and again women represented 19%. Cyber-security had the lowest female share of all, at 18%, as there were 73 thousand male specialists but only 16 thousand female specialists.

By contrast, the numbers were far more balanced in the remaining two occupations. Among web and UX designers, there were 57 thousand men and 49 thousand women, giving the highest female proportion at 46%. Similarly, women made up 43% of data analysts, with 71 thousand women and 96 thousand men working in this field.

Band 8

206 words

Well-structured overview on the degree of imbalance · figures selected and compared precisely · cohesion and referencing handled smoothly · precise vocabulary (parity, breakdown) · wide range of accurate structures.

The table provides a breakdown by sex of employment in five technology occupations in one country in 2024, with figures in thousands, and also indicates the proportion of each workforce made up of women.

Men were in the majority in all five occupations, but the degree of imbalance varied considerably. Women were most poorly represented in software development, IT support and cyber-security, while data analysis and web and UX design came much closer to parity.

Software development was the largest field by a wide margin, employing 412 thousand men, over four times the number of women (98 thousand). Women therefore accounted for just 19% of software developers, the same proportion as among IT support technicians, where 44 thousand women worked alongside 188 thousand men. Cyber-security, the smallest of the five occupations, had the lowest female share of all, at 18%, with only 16 thousand women compared with 73 thousand men.

The two remaining occupations presented a markedly different picture. Web and UX design was the most balanced, with 49 thousand women and 57 thousand men, meaning that women made up 46% of the workforce. Data analysis was only slightly less even, with 71 thousand women and 96 thousand men, giving a female share of 43%.

☐ Approved ☐ Needs changes Notes:

Ashfield, 1995

id wb1_map_01

The maps below show the village of Ashfield in 1995 and at the present time.

**Band 6**

187 words

Overview present but basic · main changes covered with some mechanical listing · repetitive linking (Also) · adequate vocabulary · several errors in tense, plurals, agreement and articles that do not block meaning.

The maps show how the village of Ashfield has changed from 1995 until now. Overall, the village become more developed and all the farmland was replaced by buildings.

In 1995, there was a river in the north and a main road from west to east. There was a church in the centre and two group of houses in the west. Also, there was farmland in the north-east and a big area of farmland in the south-west. A village shop was in the south of the road and there were a lot of trees in the south-east.

Nowadays, the farmland in the south-west has been changed to three housing estates and a new road called Ash Lane was built between them. In the north-east, the farmland was replaced by a primary school and a playing field. The village shop is not there anymore and a supermarket with a car park have been built in same area. Also, the trees in the south-east are much less than before. The footpath became a cycle path but part of it is gone. The river, church and old houses did not change.

Band 7

201 words

Clear overview of main changes · key features logically grouped by area · good range of linking · some less common vocabulary (urbanised, made way) · mostly accurate with a couple of minor slips.

The two maps illustrate the transformation of Ashfield between 1995 and the present day. Overall, the village has become far more urbanised, with almost all of its farmland giving way to housing and community facilities, while the river, the main road and the historic centre have remained intact.

The most dramatic change has taken place in the south-west. The large expanse of farmland that once lay south of Main Road has been replaced by three housing estates, which are now served by a new road, Ash Lane, running southwards from the main road between them. Similarly, the farmland in the north-east, between the road and the River Ash, has made way to a primary school and, further east, a playing field.

To the south of the main road, the small village shop has been demolished and a larger supermarket, with an adjoining car park to its east, now stands in its place. Moreover, the woodland in the south-east has shrunk to a small cluster in the corner. The footpath has also been converted into a cycle path, although its middle section, beside the supermarket, has disappeared. Meanwhile, the church and the two blocks of houses in the west has not changed.

Band 8

212 words

Well-placed overview capturing the shift from rural to residential · changes skilfully selected and located precisely · seamless cohesion · precise, natural vocabulary · wide range of structures, error-free.

The maps compare the village of Ashfield in 1995 with its current layout. The most striking development is that the countryside surrounding the village core has been almost entirely built over, turning a rural settlement into a larger residential community with modern amenities, although its basic framework of river, road and church is unchanged.

In 1995, Ashfield consisted of little more than a church and two blocks of houses on the northern side of Main Road, which crossed the village from west to east, with the River Ash flowing along its northern edge. Farmland occupied the north-east and a far larger area to the south-west, a village shop sat just south of the road, and a footpath led southwards, with extensive woodland to its east.

Today, the south-western fields have given way to three housing estates, divided by a newly built road, Ash Lane. In the north-east, a primary school and a playing field now occupy the former farmland. South of Main Road, the shop has been replaced by a considerably larger supermarket with a car park beside it, while the trees have been reduced to a small cluster in the south-eastern corner. Finally, the footpath has been converted into a cycle path, though the section alongside the supermarket no longer exists.

☐ Approved ☐ Needs changes Notes:

Brenton town centre, 2000

id wb1_map_02

The maps below show the centre of a small town called Brenton in 2000 and today.

**Band 6**

182 words

Overview present but generalised · most changes reported though listed mechanically · basic linking (Then, Also) · adequate vocabulary · frequent agreement and article errors which do not impede meaning.

The two maps illustrates the centre of Brenton town in 2000 and today. In general, there are a lot of changes, especially the High Street became for pedestrians.

In 2000, the High Street was a road from west to east. On the north side there was shops and a town hall, and there was a park in the north-west. On the south side there were some shops, a cinema, an open-air market and a big car park in the south-east. Mill Road went from the High Street to the south.

Today, the High Street is a pedestrian zone. The cinema and the market was replaced by a large shopping centre, and Mill Road has been removed. In the south-east, a bus station has been built instead of the car park. Then, a new road was built in the north. Also, a multi-storey car park is now in the north-east. The park became smaller and a play area was built next to it, and the market has moved to north of the town hall. The shops and town hall are same as before.

Band 7

198 words

Clear overview · changes well organised by area with logical progression · varied cohesive devices · good vocabulary (pedestrianised, relocated) · largely accurate with one or two minor slips.

The maps compare the layout of Brenton town centre in 2000 with its present-day appearance. Overall, the town centre has been redesigned to favour pedestrians and public transport, with traffic being moved away from the High Street to a new road in the north.

The most significant change is that the High Street, a road running from west to east in 2000, has since been pedestrianised. At the same time, a new road, New Road, has been built across the north of the town. The shops on both sides of the street, as well as the town hall, have been kept.

South of the High Street, the cinema and the open-air market have been demolished to make room for a large shopping centre, and Mill Road, which used to lead south from the High Street, no longer exist. The car park in the south-east has been replaced by a bus station, accessed by a short road from the east.

In the north-west, the park has been reduced in size, with a play area built alongside it. The market has relocated to a site north of the town hall, while a multi-storey car park has appeared in the north-east.

Band 8

202 words

Clear, well-placed overview · changes skilfully grouped into retained, northern and southern features · cohesion handled naturally · precise vocabulary (flanking, swept away, accommodate) · wide range of structures, essentially error-free.

The maps illustrate how the centre of Brenton was reorganised between 2000 and the present day. The overriding change is that the central High Street has been closed to traffic, with a new road built in the north, while several facilities have been replaced or relocated.

Several features remain as they were: the town hall on the northern side of the High Street, the two rows of shops flanking it and the block of shops in the south-west. The High Street, however, has been converted into a pedestrian zone, and New Road now crosses the northern part of the town from west to east. Meanwhile, the park in the north-west has shrunk, and part of its former area has become a children's play area.

To the south, the cinema and the open-air market have been swept away to accommodate a sizeable shopping centre, and Mill Road, which formerly ran south from the High Street, has disappeared. The large car park in the south-east has made way for a bus station reached by a short road from the east. Parking is now provided in a multi-storey car park in the north-east, and the market occupies a smaller site immediately behind the town hall.

☐ Approved ☐ Needs changes Notes:

University campus, 2010

id wb1_map_03

The maps below show changes to a university campus between 2010 and 2025.

Band 6

189 words

Basic overview · key changes covered in a before-then-after listing · simple linking (Also, Finally) · adequate vocabulary · several errors in agreement, articles, tense and a comma splice, none blocking meaning.

The maps shows how a university campus changed between 2010 and 2025. Overall, many new buildings were added, and the campus become more crowded.

In 2010, there was a main teaching building in the centre and a entrance road coming from the south. There was a lake in the north-east, student halls in the north-west and a library in the west. In the south there were a big car park and a sports field, and there were many trees in the north.

In 2025, the teaching building, the lake and the old student halls are still there. However, the car park in the south-west was replaced by a science and engineering building, and a smaller car park was built next to it. The sports field is also changed, there is a sports centre and a pitch now. The trees in the north was cut down and new student halls were built there. Also, the library was extended to the east and west. Finally, a cycle path was added which goes across the campus from west to east, and a café was built in the east near to the lake.

Band 7

201 words

Clear overview identifying expansion and what was lost · logical grouping by area · good range of cohesive devices · appropriate less common vocabulary · mostly error-free with a minor agreement slip.

The maps illustrate the development of a university campus over a fifteen-year period from 2010 to 2025. Overall, the campus has been significantly expanded with new academic, residential and sports buildings, largely at the expense of parking space and green areas, although its central core has remained the same.

The main teaching building, the entrance road leading to it from the south, the lake in the north-east and the original student halls in the north-west were all unaffected. The library in the west, however, has been extended on both sides, and the trees which covered the north of the campus have been cleared to make way for new student halls.

The southern part of the campus has seen the greatest change. The large car park in the south-west has been replaced by a science and engineering building, with only a much smaller car park beside it, next to the entrance road. To the south-east, the sports field has been divided into a sports centre and a pitch. In addition, a cycle path now crosses the whole campus from west to east, just south of the teaching building, and a small café have opened on the eastern edge, south of the lake.

Band 8

202 words

Skilful overview highlighting gains and losses · features precisely located and compared · cohesion managed effortlessly · wide, accurate vocabulary (redeveloped, taken over, compact) · varied complex structures with no noticeable errors.

The two plans show how a university campus was redeveloped between 2010 and 2025. What stands out is the considerable expansion of buildings, particularly in the south and north of the site, which came at the cost of most of the car parking and all of the woodland, while the central teaching building and the lake were left untouched.

In the north, the cluster of trees that once separated the original student halls from the lake has been cleared, and a second block of student halls has been constructed in its place. The library on the western side, meanwhile, has been enlarged in both directions.

The southern half of the campus has been transformed most radically. The extensive car park in the south-west has been largely taken over by a new science and engineering building, leaving a compact car park squeezed between this building and the main entrance road. On the opposite side of the road, the sports field has been partly built on, with an indoor sports centre now standing beside a smaller outdoor pitch. Finally, a cycle path has been laid across the campus, just south of the teaching building, and a café has been added on the eastern boundary.

☐ Approved ☐ Needs changes Notes:

Island - before development

id wb1_map_04

The two maps below show an island before and after the construction of some tourist facilities.

Band 6

189 words

Overview present though a little mechanical · main additions covered · simple and repetitive linking · adequate vocabulary · several agreement, article and punctuation errors which do not affect understanding.

The two maps shows an island before and after some tourist facilities were built on it. Overall, the island changed a lot, before it had only trees and a beach but now there are many buildings for tourists.

Before the development, the island was surrounded by the sea and had a beach on the south coast. The rest of island was covered with trees and there was no building.

After the development, a reception was built in the centre of the island and a restaurant was built to the east of it. There are also some huts for tourists, three huts are in the west and two huts are in the east. A footpath connect the huts with the reception and the restaurant, and another footpath go from the reception to the beach. Many trees were cut, but some trees are still in the north of island. In addition, a pier was built from the beach into the sea in the south, and there is a swimming area in the sea to the west of the pier. The beach did not change and it is still in the south.

Band 7

204 words

Clear overview contrasting before and after · additions presented logically from centre to coast · good cohesion · some less common vocabulary (retained, marked out) · mostly accurate with only minor slips.

The maps illustrate the transformation of a small island following the construction of tourist facilities. Overall, what was once an undeveloped island covered largely by trees has been turned into a holiday resort with accommodation and leisure facilities, although the beach along the southern coast has been retained.

Before the development, the island had no buildings at all. Apart from the beach on its southern shore, almost the entire island was wooded.

Following the development, a large number of trees were cut down, leaving only a smaller wooded area in the north. A reception building has been constructed in the centre of the island, with a restaurant immediately to its east. Accommodation is provided by a number of huts: three are located in the western part of the island and two in the east. These are linked by a footpath, which also passes the reception and the restaurant, and a separate path runs south from the reception towards the beach.

On the coast, a pier has been built out into the sea from the beach, and a swimming area has been marked out in the water to the west of it. Apart from these, the sea around the island look the same as before.

Band 8

200 words

Precise, well-placed overview · every addition accurately located and linked · excellent paragraph logic · sophisticated, natural vocabulary (flanked, projects, designated) · wide range of structures, error-free.

The maps depict an island before and after it was developed for tourism. In essence, a largely untouched, tree-covered island has been converted into a small resort, with accommodation, dining and water-based facilities added, while its southern beach has been preserved.

Originally, the island was entirely undeveloped: a beach stretched along its southern coast, and the remainder of the land was covered in trees.

After the development, much of this woodland was cleared, and trees now survive only in the northern part of the island. At the heart of the island stands a reception building, flanked to the east by a restaurant. Tourist accommodation takes the form of five huts, three of which are situated towards the west and two towards the east. A curving footpath connects the two groups of huts, passing in front of the reception and the restaurant, while a straight path leads directly south from the reception to the beach.

The shoreline has also been altered. A pier now projects into the sea from the eastern part of the beach, and a designated swimming area has been created in the water off the western end of the beach. The sea surrounding the island is otherwise unchanged.

☐ Approved ☐ Needs changes Notes:

Leenford: proposed supermarket sites

id wb1_map_05

The map below shows two possible sites, A and B, for a new supermarket in the town of Leenford.

**Band 6**

177 words

Overview present · both sites described with relevant location detail · mechanical linking (Also, So) · adequate but repetitive vocabulary · several errors in prepositions, comparatives, articles and agreement.

The map shows the town of Leenford and two places, A and B, where a new supermarket could be built. Overall, site A is near to the town and the houses, but site B is far away in the south-east corner.

The town centre is in the middle of the map and Queen's Road goes through it from north to south. Most of the houses is in the north-west and the north. In the south there is a river and a railway, which both go from west to east, and there is an industrial estate near the railway. A motorway goes from north to south in the east of the town.

Site A is in the north-east. It is next to the housing in the north and near to the end of Station Road. Site B is on the east of motorway, in the south-east. It is to the south of the railway and the river and it is near a industrial estate and farmland. So site B is more far from the houses than site A.

Band 7

201 words

Clear overview comparing the two sites · each site located accurately relative to key features · good referencing and contrast language · some less common vocabulary · mostly accurate with an agreement slip.

The map illustrates two proposed locations, labelled A and B, for a new supermarket in Leenford. Overall, site A lies close to the town's residential areas and centre, whereas site B is situated on the south-eastern outskirts, beyond the motorway and the railway.

The town centre occupies the middle of the map, with Queen's Road passing through it from north to south and the station on its eastern side. Housing is concentrated in the north-west and the north, while a park lies to the west of the centre. The River Leen and the railway line both run across the southern part of the town, and a motorway runs from north to south in the east.

Site A is located in the north-east, directly east of the northern housing area and just west of the motorway. It lies slightly to the north of the end of Station Road, which leads westwards across the town, north of the centre.

By contrast, site B is in the far south-east corner, on the eastern side of the motorway. It lies south of both the river and the railway, and its nearest neighbours is the farmland to the north and the industrial estate to the west.

Band 8

212 words

Incisive overview of the core contrast · precise location of both sites relative to roads, housing and barriers · sophisticated cohesion · accurate, varied vocabulary (periphery, bisects, adjoining) · complex structures handled without error.

The map presents two possible sites, A and B, for a new supermarket in the town of Leenford. The key difference is that site A would be located within the built-up area, close to housing and the town centre, whereas site B lies on the periphery, separated from the town by the motorway, the river and the railway.

The town is centred on a commercial area crossed by Queen's Road, with the station immediately to the east and a park to the west. Residential areas occupy the north-west and north, and Station Road runs eastwards from the western edge, north of the centre, as far as the motorway, which bisects the eastern part of the map from north to south. The River Leen and the railway both cross the southern half of the town.

Site A sits in the north-east, adjoining the northern housing area and bordered by the motorway to the east. It lies just north of the eastern end of Station Road, the main route leading westwards across the town.

Site B, in contrast, occupies the far south-eastern corner, on the eastern side of the motorway and south of both the river and the railway. Its only neighbours are farmland to the north and, across the motorway, an industrial estate.

☐ Approved ☐ Needs changes Notes:

City hospital grounds, 2005

id wb1_map_06

The maps below show the grounds of a city hospital in 2005 and at the present time.

Band 6

170 words

Overview present but general · main changes reported in a simple sequence · limited linking (Also, so) · adequate vocabulary · errors in agreement, tense, plurals and prepositions that do not block meaning.

The maps shows the grounds of a city hospital in 2005 and in the present time. Overall, the hospital has more buildings and car parks now, and the empty land was used for new facilities.

In 2005, the main hospital building was in the centre and a road connected it with Hill Road in the south. There was one car park for staff and visitors in the south-west, a big garden in the east, nurses' housing in the north and a clinic in the north-west. The north-east was vacant land.

Nowadays, the main building and the road is the same. The car park has been divided in two part, a visitor car park and a staff car park above it. A children's hospital was built in the south part of the garden, so the garden is smaller. The nurses' housing has been replaced by a cancer treatment centre and the clinic become a health centre. Also, a multi-storey car park and a helipad have been built on the vacant land.

Band 7

191 words

Clear overview · changes logically grouped by area · good range of cohesive devices · some less common vocabulary (made way, divided into) · generally accurate structures with only occasional minor imprecision.

The two maps illustrate how the grounds of a city hospital have changed since 2005. Overall, the site has been developed considerably, with several new medical buildings and extra parking, while the main hospital building and the access road from Hill Road in the south remain unchanged.

The most noticeable development has occurred in the north of the site. The vacant land in the north-east has been used for a multi-storey car park and a helipad, and the nurses' housing to the north of the main building has been replaced by a larger cancer treatment centre. Similarly, the clinic in the north-west has made way for a larger health centre.

In the southern half of the grounds, the single car park for staff and visitors has been divided into two, with a visitor car park in the south-west and a staff car park directly to its north. To the east, the garden has lost its southern section to a new children's hospital, so it is now less than half its former size. Finally, a short road has been added, leading from the eastern side of the main building towards the garden.

Band 8

203 words

Well-judged overview · changes selected and located with precision · cohesion managed naturally across paragraphs · wide, accurate vocabulary (intensively used, reorganised) · complex structures used flexibly and without error.

The maps compare the grounds of a city hospital in 2005 and today. In short, the site has become far more intensively used, as open space has been built on to provide additional medical services and parking, although the central hospital building and its access road from Hill Road are unchanged.

The northern part of the site has undergone the most extensive change. What was once vacant land in the north-east is now occupied by a multi-storey car park and, further east, a helipad. Next to them, the nurses' housing has been replaced by a somewhat larger cancer treatment centre, while the clinic in the north-west has given way to a health centre.

Further south, parking arrangements have been reorganised: the single staff and visitor car park in the south-west has been split, with visitors now using the southern section and staff the northern one. On the eastern side of the grounds, the garden, which once stretched from near Hill Road as far as the level of the hospital's northern wall, has been reduced to a strip in the north, as a children's hospital now stands on its southern half. A short road connecting the main building with the garden completes the changes.

☐ Approved ☐ Needs changes Notes:

Grange Park, 1980

id wb1_map_07

The plans below show a public park when it first opened in 1980 and as it is today.

**Band 6**

185 words

Basic overview · most changes covered though some are listed mechanically · repetitive linking · adequate vocabulary with some imprecision · several agreement and preposition errors that do not affect understanding.

The plans show Grange Park in 1980 when it was opened and how it looks today. In general, the park have more facilities for sport and leisure now, but the lake and the main paths are the same.

In 1980 there was a lake in the centre of the park, with a main path from the west and a footpath to the east. There was trees in the north-west and south-east, tennis courts in the south-west, flower gardens in the north and a café and toilets in the north-east.

Today, the tennis courts has been replaced by a skate park and the trees in the south-east was changed into an outdoor gym. The flower gardens became a wildflower meadow, and some trees in the north-west were removed to build a children's playground. Also, the café is bigger now and it is a café and visitor centre. The toilets moved to the south, next to the café. Another change is a new cycle path from the south of the park to the lake, and a car park was built in the south next to it.

Band 7

191 words

Clear overview identifying a change in character · key changes organised logically by area · range of linking devices · some less common vocabulary · mostly accurate with a minor agreement slip.

The plans illustrate the layout of Grange Park when it first opened in 1980 and its present-day design. Overall, the park has shifted from a traditional, largely green space towards one offering more active leisure facilities, although its central lake and the main paths leading to it have been retained.

In the southern half of the park, the tennis courts in the south-west have been converted into a skate park, while the trees in the south-east have been cleared to make room for an outdoor gym. In addition, a new cycle path now runs north from the southern edge of the park to the lake, and a car park has been built beside it, to the west.

The northern part has also been transformed. The trees in the north-west have been reduced, and a children's playground now occupies the land next to them. The flower gardens have been replaced by a smaller wildflower meadow, and the café in the north-east has been expanded into a café and visitor centre. Lastly, the toilets, which were located in the north-eastern corner, has been moved a little further south, next to the café.

Band 8

204 words

Incisive overview capturing the change in the park's character · effective before-and-after organisation · smooth cohesion · precise vocabulary (ornamental, cut back, incorporate) · wide range of accurate complex structures.

The two plans show Grange Park at its opening in 1980 and as it appears today. The most notable development is that much of the park's natural and ornamental landscape has been replaced by facilities for active recreation, while its core layout, the central lake with paths approaching from the west and east, has survived intact.

In 1980, the park was dominated by greenery: woodland occupied both the north-west and the south-east, and a large area of flower gardens lay to the north of the lake. The only facilities were tennis courts in the south-west and a café and toilets in the north-east.

Since then, the tennis courts have been turned into a skate park, and the south-eastern woodland has given way to an outdoor gym. The trees in the north-west have been cut back to make space for a children's playground, and the flower gardens have been replaced by a somewhat smaller wildflower meadow. The café has been enlarged to incorporate a visitor centre, with the toilets relocated from the far corner to a spot just east of it. Access has also been improved, with a cycle path now leading from the southern boundary to the lake and a car park alongside it.

☐ Approved ☐ Needs changes Notes:

Harbour area, 1985

id wb1_map_08

The maps below show an area of a city harbour in 1985 and after redevelopment in 2025.

**Band 6**

163 words

Clear but simple overview · all key changes included though presented as a list · mechanical linking (Also) · adequate vocabulary · errors in plurals, agreement and prepositions that do not obscure meaning.

The maps shows a part of a city harbour in 1985 and after it was redeveloped in 2025. Overall, the area was industrial in 1985 but in 2025 it is used for living and leisure.

In 1985, there were two warehouse and a factory next to the harbour, and a customs office in the east. There was two cranes at the edge of the water. A goods railway went across the area from west to east and there was a storage yard in the north-west, near to Dock Road.

In 2025, the warehouses have been replaced by two blocks of apartments. The factory was converted into an art gallery and the customs office became a restaurant. Also, the storage yard is now a park and a car park, and the railway changed to a cycle path. Along the water there is a new waterfront promenade, and instead of cranes there is two marina jetties now. Dock Road and the harbour stayed the same.

Band 7

189 words

Clear overview · logical before-and-after structure with key features highlighted · good cohesion · appropriate vocabulary (dominated, converted) · mostly accurate, with a slight tense inconsistency and an agreement slip.

The maps compare an area of a city harbour in 1985 with the same area after its redevelopment in 2025. Overall, the harbour has been transformed from an industrial zone into a residential and leisure area, with most former industrial buildings either replaced or converted to new uses.

In 1985, the area was dominated by industry. Two warehouses and a factory stood beside the harbour, with a customs office further east, and two cranes were positioned at the water's edge. A goods railway crossed the site from west to east, and to the north of it there was a large storage yard next to Dock Road.

By 2025, the two warehouses had been demolished and replaced by apartment blocks, while the factory had been converted into an art gallery. The customs office has also been turned into a restaurant. The storage yard has made way for a park and a car park, and the railway line has become a cycle path. Along the water, a waterfront promenade has been created and the cranes have been replaced with two marina jetties. Only Dock Road and the harbour itself remains unchanged.

Band 8

203 words

Sharp overview of the change in function · features compared precisely, including positions · cohesion natural and varied · sophisticated, accurate vocabulary (reinvented, adapted, houses) · wide range of structures, error-free.

The maps illustrate the redevelopment of a city harbour area between 1985 and 2025. Broadly speaking, a working industrial waterfront has been reinvented as a residential and leisure district, with almost every industrial feature either replaced or adapted for a new purpose.

In 1985, the waterfront was lined with two warehouses in the west and centre and a factory in the east, beyond which stood a customs office. Two cranes stood at the water's edge, and a goods railway ran parallel to the harbour, separating these buildings from a storage yard that bordered Dock Road to the north.

By 2025, the warehouses had been replaced by two apartment blocks, and the factory had been converted into an art gallery, while the former customs office now houses a restaurant. The railway has been turned into a cycle path following almost the same route, and the storage yard to its north has been divided between a park and a car park. At the water's edge, a promenade now runs the full length of the harbour, and the two cranes have disappeared, with two marina jetties extending into the water slightly further east. Dock Road and the harbour itself are the only features left entirely unaltered.

Regional airport, 2000

id wb1_map_09

The maps below show a regional airport in 2000 and after its expansion in 2024.

**Band 6**

178 words

Overview present · main developments covered · simple, formulaic linking (Also, Finally) · adequate vocabulary · several errors in verb form, articles, relative clauses and agreement that do not block meaning.

The maps show a regional airport in 2000 and after it was expanded in 2024. Overall, the airport became much bigger, with a second runway and a second terminal, and the farmland is not there anymore.

In 2000, the airport had one terminal in the centre, which was connected to the motorway in the north by a road. There was only one runway in the south and a car park next to the terminal on the east side. There was farmland in the west and in the east of the airport.

In 2024, Terminal 1 and the first runway are still there. However, a second runway has been build to the north of the first one and it is same length. Terminal 2 was built in the west, where was farmland before, and it has a new road to the motorway. Also, the car park changed into a multi-storey car park and a hotel was built next to it. Finally, there is a rail link now which come from the west to a station between the two terminals.

Band 7

191 words

Clear overview · developments logically sequenced from past to present · good range of linking and reference · appropriate vocabulary (parallel, redeveloped) · mostly error-free with a minor tense inconsistency.

The maps illustrate the expansion of a regional airport between 2000 and 2024. Overall, the airport has grown significantly, gaining a second runway, a second terminal and improved transport links, much of which has been built on land that was previously farmland.

In 2000, the airport was relatively simple. It consisted of Terminal 1 in the centre, linked to the motorway in the north by a short road, a single runway along the south of the site and a car park on the eastern side of the terminal. The land to the west and to the south-east of the terminal was farmland.

By 2024, a second runway had been constructed parallel to the original one and just north of it, running the full width of the site. Terminal 2 has been built on the former farmland in the west and has its own access road from the motorway. In addition, a rail link now runs from the west to a small station located just north of the terminals. On the eastern side, the car park has been redeveloped as a multi-storey car park, and a hotel has been constructed beside it.

Band 8

198 words

Precise overview of scale and nature of the expansion · key features skilfully selected and compared · seamless cohesion · wide, precise vocabulary (comprised, absorbed, terminates) · wide range of structures, no errors.

The two maps compare a regional airport in 2000 with the same site following its expansion in 2024. The most significant changes are the doubling of the number of runways and terminals and the addition of a rail connection, with the surrounding farmland disappearing entirely.

In 2000, the airport comprised a single terminal at its centre, reached by a short road from the motorway to the north, together with one runway stretching across the southern part of the site. A car park adjoined the terminal to the east, and farmland covered the land to the west and south-east.

By 2024, a second runway had been laid parallel to the first, slightly further north, while a new terminal, Terminal 2, had been built on the western farmland, served by a separate access road from the motorway. Rail passengers can now reach the airport via a line from the west, which terminates at a small station just north of the terminals. On the eastern side, the original car park has been replaced by a multi-storey facility on the same site, and a hotel now stands immediately to its east. Terminal 1, its access road and the original runway are unchanged.

Seaview, 1950

id wb1_map_10

The maps below show the coastal town of Seaview in 1950 and 2020.

**Band 6**

172 words

Overview present though it slightly over-interprets · key changes covered in a basic sequence · mechanical linking · adequate vocabulary · several errors in agreement, articles, tense and word choice that do not block meaning.

The maps show the town of Seaview on the coast in 1950 and 2020. Overall, the town changed from a small fishing village with farmland to a tourist town with more buildings.

In 1950, there was a hotel in the middle of the town and a church in the east, both next to Coast Road. There were two groups of fishermen's cottages in the west. A pier went into the sea from the beach. In the north there was a big farmland and some trees in the north-east, and a railway was going from west to east across the town.

In 2020, the hotel, the church and the beach are the same. The fishermen's cottages were changed to cafes and shops, and the pier is shorter than before. The farmland has been replaced by housing and holiday apartments, and the trees have become a car park. Also, the railway is removed and there is a new road called Hill Road going to the north. Finally, a seafront walkway was built along the beach.

Band 7

182 words

Clear overview · changes grouped logically into coast and north · effective cohesive devices · good vocabulary (tourist-oriented, converted) · largely error-free sentences with at most a minor slip.

The maps illustrate the changes that took place in the coastal town of Seaview between 1950 and 2020. Overall, the town has developed from a fishing settlement surrounded by countryside into a busier, more tourist-oriented resort, while its coastline and a few key buildings have been retained.

Along the coast, the beach and Coast Road remain unchanged, as do the hotel in the centre and the church in the east. However, the two rows of fishermen's cottages in the west have been converted into cafés and shops, and the pier has been shortened. A seafront walkway has also been built running along the entire length of the beach.

The most striking changes are in the north. The large area of farmland has been replaced by housing in the north-west and holiday apartments in the north, while the trees in the north-east have been cut down to create a car park. Moreover, the railway which ran across the town in 1950 has disappeared, and a new road, Hill Road, now leads north from Coast Road, between the apartments and the car park.

Band 8

194 words

Perceptive overview of the town's shift in function · clear division between coast and inland changes · sophisticated cohesion · precise vocabulary (evolved, built over, no longer extends) · varied complex structures, error-free.

The maps depict Seaview, a coastal town, in 1950 and 2020. Over this seventy-year period, the town evolved from a modest fishing community set among farmland and trees into a tourism-focused resort, with most of its open land developed, while its seafront and principal landmarks were largely retained.

The southern part of the town has kept its essential character. The beach, Coast Road, the hotel and the church are all still in place, but the fishermen's cottages in the west now house cafés and shops, and the pier no longer extends as far out to sea. In addition, a walkway has been laid along the full length of the seafront.

North of the coast road, the transformation has been far more dramatic. The railway that once crossed the town from west to east has been removed altogether, and the extensive farmland beyond it has been built over, with housing in the north-west and a large block of holiday apartments to its east. The woodland in the north-east has been cleared for a car park, and a new route, Hill Road, now runs northwards from Coast Road, separating the apartments from the car park.

☐ Approved ☐ Needs changes Notes:

School grounds, 2000

id wb1_map_11

The maps below show changes to the grounds of a secondary school between 2000 and 2024.

**Band 6**

166 words

Overview present but simple · key changes identified though some explanation is mechanical · limited linking · adequate vocabulary · errors in verb form, agreement and a comma splice, none blocking meaning.

The maps shows the grounds of a secondary school in 2000 and 2024. Overall, the school has more buildings and sports facilities now, but the main building, the car park and the playground did not changed.

In 2000, the main school building was in the centre with a road going to School Lane in the south. There was a big playing field in the north-west, a car park in the south-west and a playground in front of the main building. In the east there was a gym, and in the north there was a small staff room and a large garden in the north-east.

By 2024, the playing field became smaller because a science block was built on the east part of it. The staff room was removed. The gym was replaced by a bigger sports hall, and a canteen was built to the east of it. Also, the garden is not there anymore, there is tennis courts and a vegetable garden in the north-east now.

Band 7

190 words

Clear overview · logical organisation separating unchanged and changed features · range of cohesive devices · good vocabulary (at the expense of, occupies) · mostly accurate with minimal errors.

The maps illustrate how the grounds of a secondary school changed between 2000 and 2024. Overall, the school has gained several new buildings and sports facilities, mainly at the expense of green space, while the central part of the site has remained largely unchanged.

Several features were unaffected. The main school building still stands in the centre, connected to School Lane in the south by the same road, and both the car park in the south-west and the playground in front of the main building have been kept.

In the north of the site, however, the playing field has been reduced to just over half of its original width, as a science block now occupies its eastern section. The small staff room that stood to the north of the main building has been demolished. Further east, the garden has disappeared and in its place there are now tennis courts and a smaller vegetable garden.

On the eastern side of the main building, the gym has been replaced by a larger sports hall, and a canteen, which did not exist in 2000, has been built next to it on the east.

Band 8

183 words

Clear, well-placed overview · changes grouped logically with precise locations · smooth referencing (beyond which, the latter) · wide, natural vocabulary · complex structures used accurately throughout.

The plans compare the grounds of a secondary school in 2000 and 2024. The overall trend has been one of expansion, with new teaching, sports and catering facilities added largely on former open ground, whereas the core of the school, including its access road, car park and playground, was preserved.

The main building remains at the centre of the site, reached from School Lane to the south by the original road, with the playground directly in front of it and the car park in the south-western corner. To its east, however, the modest gym has been replaced by a sports hall of greater size, beyond which a canteen has been added.

The most substantial changes have taken place in the northern half of the grounds. The playing field, which formerly extended across much of the north-west, has been cut back to a narrower strip to make room for a science block, and the small staff room nearby has been removed. Meanwhile, the garden in the north-east has been divided between tennis courts and a vegetable garden, the latter occupying the far eastern edge.

☐ Approved ☐ Needs changes Notes:

Library ground floor - current

id wb1_map_12

The plans below show the ground floor of a public library at present and a proposed redesign.

Band 6

183 words

Overview present but general · main proposed changes covered · linking mostly basic · adequate vocabulary with left and right used instead of compass directions · several agreement and verb form errors.

The plans show the ground floor of a public library now and how it will look after a proposed redesign. Overall, some parts will stay the same, but many areas will be smaller and some new rooms like a café and a computer room will be added.

At present, when people come in from the entrance in the south, the reception and returns desk is in front of them and the newspapers and magazines section is behind it. The fiction books is on the left side and non-fiction is on the right. In the north there are a big reference and reading room, the children's books, and also an office and toilets in the north-east.

In the new design, the reception, office and toilets will not change. The fiction and non-fiction sections will be smaller, because a café will be added next to fiction and a computer room next to non-fiction. The newspapers area will be replaced with self-service machines. Also, the reference room will be divide into a quiet study and meeting rooms, and the children's area will have a story corner.

Band 7

192 words

Clear overview of the direction of change · logical division into southern and northern areas · effective cohesion · appropriate vocabulary with conditional forms used consistently · few, if any, errors.

The plans compare the current layout of a public library's ground floor with a proposed redesign. Overall, the new design would reduce the space used for traditional book collections and introduce more areas for technology, study and social activities, while the reception, office and toilets would remain where they are.

In the southern half of the building, the reception and returns desk just inside the entrance would stay the same, but the newspapers and magazines area behind it would be replaced by self-service machines. The fiction section in the south-west and the non-fiction section in the south-east would both lose a large part of their space, making room for a café to the north of fiction and a computer room to the north of non-fiction.

In the northern half, the large reference and reading room in the north-west would be split into two parts, with a quiet study area on the western side and meeting rooms next to it. The children's books section would become a children's area with a story corner, although it would occupy the same space as before. The office and the toilets in the north-east would be unchanged.

Band 8

185 words

Insightful overview · proposed changes skilfully sequenced as a visitor moves through the building · sophisticated cohesion · precise vocabulary (subdivided, space released) · wide range of structures, accurate throughout.

The floor plans show the existing ground floor of a public library alongside a proposed redesign. The proposal represents a clear shift away from traditional reading space towards technology and flexible study areas, with the entrance, reception, office and toilets left as they are.

Visitors entering from the south would still find the reception and returns desk immediately ahead of them. Beyond it, however, the newspapers and magazines section would give way to self-service machines. On either side, the fiction and non-fiction collections, which currently fill the south-western and south-eastern corners, would each lose a substantial part of their present depth; the space released would accommodate a café on the western side and a computer room on the eastern side.

The northern half of the floor would also be reorganised. The spacious reference and reading room in the north-west would be subdivided into a quiet study area and a set of meeting rooms, whereas the children's books section would be reinvented as a children's area with a story corner, occupying the same floor space. The office and toilets in the north-eastern corner would remain unaltered.

☐ Approved ☐ Needs changes Notes:

Museum ground floor, 1990

id wb1_map_13

The plans below show the ground floor of a museum in 1990 and today.

**Band 6**

169 words

Overview present but basic · key changes all mentioned · basic sequencing and linking · adequate vocabulary · several errors in agreement, articles and word order, not affecting meaning.

The two plans show the ground floor of a museum in 1990 and at present. Overall, the museum today has more different facilities for visitors, such as a café and a gift shop, and the storage and offices have gone.

In 1990, visitors entered through the main entrance in the south into the entrance hall. Behind it was a ticket office. There was a local history gallery on the west and a natural history gallery on the east. In the north, there were a large painting gallery, a storage room and offices.

Today, the entrance hall and the local history gallery are same as before, but the ticket office has become an information desk. The natural history gallery was removed and a gift shop and a café is there now. The painting gallery is smaller than in 1990. The storage and the offices has been replaced by an interactive science zone, an education room and a area for temporary exhibitions. Also a lift has been added in the south-east.

Band 7

175 words

Clear overview · changes presented logically from south to north · good cohesive devices · some less common vocabulary · generally accurate with an agreement slip.

The plans illustrate the layout of a museum's ground floor in 1990 and today. Overall, the museum has become more focused on visitor services and interactive learning, with storage and office space being converted into new exhibition areas.

In the southern half of the building, the main entrance and the entrance hall are unchanged, as is the local history gallery in the south-west. However, the ticket office in the centre has been replaced by an information desk, and the natural history gallery in the south-east has been removed. In its place, there are now a gift shop and, directly to its north, a café. A lift has also been installed in the south-east corner.

The northern half has undergone even more significant changes. The painting gallery in the north-west still exists but it has been reduced to about two-thirds of its former width. Next to it, an interactive science zone has been created, and the rooms previously used for storage and offices has been turned into an education room and a temporary exhibitions space.

Band 8

189 words

Precise overview of the shift in use · changes described in a clear spatial sequence · cohesion subtle and effective · wide, accurate vocabulary (back-of-house, reconfigured) · varied complex structures with no errors.

The plans compare the ground floor of a museum in 1990 with its current layout. Broadly speaking, back-of-house areas and one of the permanent galleries have made way for visitor facilities and more varied exhibition spaces, while the entrance area and the local history gallery have been retained.

On entering from the south, visitors still pass through the same entrance hall, beyond which the former ticket office now serves as an information desk. The local history gallery to the west is unchanged, but the natural history gallery that once occupied the south-eastern part of the floor has disappeared, its space now shared between a gift shop at the front and a café behind it. In addition, a lift has been installed in the south-eastern corner.

The northern side of the building has been reconfigured more extensively. The painting gallery, which previously stretched across nearly half the width of the floor, has been reduced in size, allowing an interactive science zone to be inserted beside it. The storage area and offices further east are no longer present, having been replaced by an education room and a space for temporary exhibitions.

☐ Approved ☐ Needs changes Notes:

Station area, 1995

id wb1_map_14

The maps below show the area around a railway station in 1995 and after redevelopment in 2025.

**Band 6** 181 words

Overview present but general · all main changes covered in a list-like way · formulaic linking · adequate vocabulary · several errors in plurals, tense, agreement and articles, none impeding meaning.

The maps show the area around a railway station in 1995 and after it was redeveloped in 2025. Overall, the area became more modern, with many new building and better transport facilities, but the station and the railway did not change.

In 1995 there was the station next to the railway and a small road went from it to Station Road in the north. In the west there was a goods depot and in the east a car park. On the other side of Station Road there was a post office. In the south, below the railway, all the land was disused.

In 2025, the road from the station has been replaced by a station square. The car park has changed into a bus interchange and a taxi rank. Also, the goods depot become an office block and the post office became a hotel. The disused land was used for apartments in the south-west, a park in the middle and a new car park in the south-east. Finally, there is a footbridge which cross the railway from the park to station.

Band 7

186 words

Clear overview · key features logically grouped north and south of the railway · varied linking · good vocabulary (transport hub, made way) · mostly error-free sentences.

The maps compare the area surrounding a railway station in 1995 with the same area after its redevelopment in 2025. Overall, the site has been transformed from a partly industrial and underused area into a modern transport hub with housing, offices and green space, although the railway, the station and Station Road have been retained.

North of the railway, the short road linking the station to Station Road has been replaced by a pedestrian station square. The car park to the east of the station has been converted into a bus interchange and a taxi rank, while the goods depot to the west has made way for an office block. On the opposite side of Station Road, the post office has been replaced with a hotel.

The biggest change, however, can be seen south of the railway, where a large area of disused land has been completely developed. Apartments now occupy the western part of this land, with a park in the middle and a car park to the east. In addition, a footbridge has been constructed over the railway, connecting the park with the station.

Band 8

190 words

Clear, perceptive overview · changes skilfully grouped by conversion versus new development · cohesion handled naturally · precise vocabulary (regenerated, mixed-use, spanning) · wide range of accurate structures.

The maps depict the area around a railway station before and after its redevelopment, in 1995 and 2025 respectively. In essence, a district of industrial and disused land has been regenerated into a mixed-use area centred on public transport, with the railway line, the station and Station Road the only features left intact.

To the north of the railway, the changes have largely involved converting existing sites. The access road that ran from the station up to Station Road has been replaced by a pedestrianised square, and the car park immediately east of the station has been divided between a bus interchange and a taxi rank. Similarly, the goods depot on the western side has given way to an office block, and across Station Road the post office has been replaced by a hotel.

South of the tracks, a formerly disused stretch of land has been developed for the first time. Its western portion is now occupied by apartments, the centre by a park and the eastern end by a car park. These new facilities are linked to the station by a footbridge spanning the railway line from the park.

☐ Approved ☐ Needs changes Notes:

Hollin Farm, 2005

id wb1_map_15

The maps below show a farm in 2005 and the same site after it was converted into an eco-park in 2024.

**Band 6**

179 words

Overview present · key changes covered with limited detail on positions · simple linking · adequate vocabulary · several errors in agreement, articles and verb forms that do not block meaning.

The maps show Hollin Farm in 2005 and the same place in 2024 when it became an eco-park. Overall, the farming land and buildings was changed for visitors and nature, but the roads, the stream, the farmhouse and the trees are the same.

In 2005, the farmhouse was in the north of the farm next to Country Road, and there was a barn and a cattle shed to the east of it. There was a wheat field in the west and a grazing land in the east, and a stream in the south. There were also trees in the north-west.

In 2024, the wheat field has been changed to a wildflower meadow and a pond was made next to it, with a bird hide near the pond. The grazing land is now a camping area. Also the barn became a visitor centre and the cattle shed became toilets and showers. A car park has been build near to the trees in the north-west. In addition, there is a nature trail that go around the meadow and the camping area.

Band 7

194 words

Clear overview · features presented logically in time order · good range of linking · appropriate vocabulary (adapted, preserved) · mostly accurate with a minor tense shift.

The maps illustrate how Hollin Farm was converted into an eco-park between 2005 and 2024. Overall, the agricultural land and farm buildings have been adapted for leisure and wildlife, whereas the basic layout, including the farmhouse, the roads, the stream and the trees, has been preserved.

In 2005, the farmhouse stood in the north of the site, connected to Country Road by a short road, with a barn and a cattle shed to its east. The land to the south was used for farming, with a wheat field in the west and grazing land in the east, and a stream flowed along the southern edge.

By 2024, the barn had been turned into a visitor centre and the cattle shed into toilets and showers. The wheat field has been replaced by a wildflower meadow and a pond, beside which a bird hide has been built, while the grazing land is now a camping area. A car park has been added between the trees in the north-west and Country Road. Finally, a nature trail now leads down the western side of the site, runs alongside the stream and goes back up on the eastern side.

Band 8

203 words

Sharp overview · changes skilfully selected and precisely located · excellent cohesion (the former, the remainder) · precise, varied vocabulary (repurposed, given over, framed) · wide range of structures, error-free.

The maps show Hollin Farm in 2005 and the same site in 2024, following its conversion into an eco-park. The essential shift has been from agriculture to recreation and conservation, with fields and farm buildings repurposed, although the framework of the site, namely the roads, farmhouse, stream and woodland, remains exactly as before.

The farmhouse still sits in the north, reached by a short road from Country Road, and the cluster of trees to its west has been kept. The two former farm buildings to the east have both been given new functions: the barn now serves as a visitor centre, while the cattle shed has been converted into toilets and showers. A small car park has also been laid out just south of Country Road, alongside the trees.

The greatest changes are to the farmland itself. The western wheat field has been partly transformed into a wildflower meadow, with the remainder of the field given over to a pond overlooked by a bird hide. To the east, the grazing land has become a camping area. These areas are now framed by a nature trail, which descends the western side of the site, follows the stream and climbs back up the eastern side.

☐ Approved ☐ Needs changes Notes:

Shopping centre ground floor, 2010

id wb1_map_16

The plans below show the ground floor of a shopping centre in 2010 and 2024.

Band 6

162 words

Overview present but basic · all changes identified and grouped by side · repetitive linking and structures · adequate vocabulary · errors in articles, agreement and comparatives which do not block meaning.

The plans show the ground floor of a shopping centre in 2010 and in 2024. Overall, the layout of the centre is same, but many shops have changed into places for food, leisure and services.

In both years, there is a central walkway from the west to the east with entrances at each end, and also a north entrance. On the north side of the walkway, the clothes shop and the supermarket did not change. However, the department store in the north-west became a food court and the bookshop was replaced with a phone shop.

On the south side, only the shoe shop is still there. The electronics shop in the south-west have been changed to a gym. The bank next to shoe shop is now parcel lockers and click-and-collect, and the travel agent became a pharmacy. Finally, the café in the south-east was replaced by a cinema. So in 2024 there are less traditional shops and more places for doing activities.

Band 7

188 words

Clear overview of the shift in use · changes presented logically side by side · cohesive devices used well · good vocabulary (outlets, taken over) · largely accurate with one agreement slip.

The plans compare the ground floor of a shopping centre in 2010 and 2024. Overall, while the basic layout and the size of each unit have remained the same, the centre has moved away from traditional retail towards leisure, food and service outlets.

The central walkway, which runs from west to east with entrances at both ends and a third entrance in the north, is unchanged. Along its northern side, the clothes shop and the large supermarket in the north-east have been kept. However, the department store in the north-west has been converted into a food court, and the neighbouring bookshop has been taken over by a phone shop.

The southern side of the building has seen even more change, as the shoe shop is the only unit which still has the same use. The electronics store in the south-west has become a gym, while the bank in the middle has been replaced by parcel lockers and a click-and-collect point. Further east, a pharmacy now occupy the unit which used to be a travel agent, and the café in the south-east corner has made way for a cinema.

Band 8

192 words

Excellent overview contrasting fixed structure with changing use · changes sequenced logically along each side · precise summary comparison · sophisticated vocabulary (tenants, succeeded by) · wide range of structures, error-free.

The floor plans show how the ground floor of a shopping centre changed between 2010 and 2024. Although the physical structure of the building, including the central walkway, the three entrances and the size of every unit, is identical in both years, the mix of tenants has shifted markedly from conventional shops towards leisure, dining and everyday services.

North of the walkway, two of the four units, the clothes shop and the supermarket at the eastern end, have retained their original use. By contrast, the department store in the north-west has been converted into a food court, and the adjacent bookshop has been replaced by a phone shop.

The transformation is more thorough on the southern side, where only the shoe shop survives. Its western neighbour, formerly an electronics store, now houses a gym, while the bank to its east has been turned into a parcel locker and click-and-collect facility. Continuing eastwards, the travel agent has been succeeded by a pharmacy, and the café occupying the south-eastern corner has given way to a cinema. In total, of the nine units shown, only three are used in the same way as in 2010.

☐ Approved ☐ Needs changes Notes:

Sports complex - before

id wb1_map_17

The maps below show a community sports complex before and after its redevelopment.

**Band 6**

168 words

Overview present · main changes covered with some supporting detail · simple linking · adequate vocabulary · errors in agreement, articles, tense and a comma splice that do not affect meaning.

The maps show a community sports complex before and after it was redeveloped. Overall, the complex has more sports facilities after the redevelopment, and the grass area is not there anymore.

Before the redevelopment, there was a leisure centre in the middle and a car park in the south-west, near Park Avenue. There were a football pitch in the north-west, an athletics track in the north-east and an outdoor pool in the north, behind the leisure centre. The south-east was only a grass area.

After the redevelopment, the leisure centre, the car park and the athletics track stay the same. The football pitch has been changed to a 3G artificial pitch, and the outdoor pool became a indoor pool which is a little bigger. The biggest change is in the grass area, it has been replaced by tennis courts, a climbing wall and a café. Also, a running path was build from the car park to the east side, between the new facilities and the leisure centre.

Band 7

180 words

Clear overview · logical organisation by area · range of cohesive devices · appropriate vocabulary (upgraded, developed into) · mostly accurate with a minor agreement error.

The maps illustrate a community sports complex before and after its redevelopment. Overall, the complex has been upgraded and expanded, with the grass area in the south-east completely replaced by new facilities, while the leisure centre, the car park and the athletics track have been kept.

In the northern half of the site, the athletics track in the north-east has remained unchanged. However, the football pitch in the north-west has been replaced by a 3G artificial pitch, and the outdoor pool behind the leisure centre has been replaced by a slightly larger indoor pool.

The most noticeable changes have taken place in the south. The large grass area between the car park and the eastern edge of the site, which used to be empty, has been developed into three separate facilities: tennis courts, a climbing wall and, in the far south-east, a small café. Furthermore, a running path has been added. It starts at the north-eastern corner of the car park and run eastwards to the edge of the complex, passing between these new facilities and the leisure centre.

Band 8

199 words

Clear, well-judged overview · changes skilfully selected and precisely positioned · seamless referencing and cohesion · precise vocabulary (superseded, built over) · wide range of complex structures, error-free.

The maps compare a community sports complex before and after it was redeveloped. In general, the complex now offers a far wider range of facilities, with the formerly unused grass area put to use and two existing facilities modernised, although its overall layout around the central leisure centre is unchanged.

The leisure centre itself, the car park beside Park Avenue in the south-west and the athletics track in the north-east all remain in their original form. The football pitch in the north-west, however, has been replaced by a 3G artificial pitch of the same size, and the outdoor pool to the north of the leisure centre has been superseded by a slightly larger indoor pool.

The southern half of the complex has undergone the most radical transformation. The open grass area that previously stretched from the car park to the eastern boundary has been entirely built over, with tennis courts nearest the car park, a climbing wall to their east and a small café in the south-eastern corner. These new facilities are separated from the leisure centre by a newly laid running path, which leads eastwards from the corner of the car park to the edge of the site.

Housing estate, 1970

id wb1_map_18

The maps below show a housing estate in 1970 and after regeneration in 2020.

**Band 6**

162 words

Overview present · key changes covered in a mostly list-like way · basic linking · adequate vocabulary · errors in comparative form, agreement and articles that do not block meaning.

The maps show a housing estate in 1970 and after it was regenerated in 2020. Overall, the estate became more greener and has more facilities for the people, but the two main roads, terraced houses and shops are same.

In 1970, Ring Road and Oak Avenue crossed in the middle of the estate. There was tower blocks in the north-west and terraced houses in the north-east, with open grassland behind them. In the south-west there were garages and a car park, and in the south there were shops and a waste ground.

In 2020, the tower blocks have been replaced by low-rise flats and houses. The open grassland is now a park and a play area. In the south-west, the garages were removed and there is a smaller car park, a community centre and allotments. Also, a medical centre was built on the waste ground and some trees was planted next to it. The terraced houses and the shops did not change.

Band 7

181 words

Clear overview · changes logically divided by Ring Road · good cohesion and referencing · appropriate vocabulary (regeneration, community-focused) · mostly error-free with a minor agreement slip.

The maps illustrate a housing estate in 1970 and the same estate following its regeneration in 2020. Overall, the estate has been transformed into a more varied and community-focused neighbourhood, with high-rise housing and unused land replaced by lower buildings, services and green spaces, while the road layout has been retained.

In both years, Ring Road runs from west to east and crosses Oak Avenue in the centre of the estate. North of Ring Road, the tower blocks in the north-west have been demolished and replaced by low-rise flats and houses. The terraced houses in the north-east have been kept, but the open grassland behind them has been divided into a park and a play area.

South of Ring Road, the garages and car park which took up the whole south-west have been reduced to a smaller car park, next to which a community centre has been built, with allotments to the north of both. The shops remain in the same place, whereas the waste ground in the south-east have been developed into a medical centre and an area of trees.

Band 8

191 words

Perceptive overview · features precisely compared quarter by quarter · cohesion natural and effective · sophisticated, precise vocabulary (lower-density, scaled down, land released) · wide range of structures, error-free.

The maps depict a housing estate in 1970 and after its regeneration in 2020. The overarching change is a move away from high-rise blocks and neglected land towards lower-density housing, community services and landscaped green space, all within an unchanged street pattern.

The estate is still divided into quarters by Ring Road, running east to west, and Oak Avenue, running north to south. In the north-west, the tower blocks have been cleared and replaced by low-rise flats on the western side and houses to their east. Across Oak Avenue, the terraced houses remain, but the open grassland behind them has been landscaped into a park with a play area at its eastern end.

South of Ring Road, the garages and car park that once filled the south-western quarter have been scaled down to a single car park, and the land released now accommodates a community centre and, to their north, a strip of allotments. The shops beside Oak Avenue have been retained, while the former waste ground in the south-east has been put to use, with a medical centre in its southern part and a cluster of trees to the north.

☐ Approved ☐ Needs changes Notes:

Hadley: proposed bypass routes

id wb1_map_19

The map below shows the town of Hadley and two proposed routes for a new bypass road.

Band 6 187 words

Overview present · both routes described in sequence with relevant features · formulaic linking (Then, After that) · adequate vocabulary · several agreement and preposition errors that do not block meaning.

The map shows the town of Hadley and two possible routes for a new bypass road. Overall, route 1 goes around the north of the town and route 2 goes around the south, and both of them start and finish at the A12.

Hadley town centre is in the middle of the map and the A12 go into it from the west and leave it to the east. There is housing in the north and in the south of the town centre. The River Hale runs from north to south on the west side of the town. There is a school in the north-west, trees in the north-east and farmland in the south-east.

Route 1 starts from the A12 in the west and goes north, near to the school. Then it cross the river and passes to the north of the housing. After that it goes through the north part of the woodland and comes down to the A12. Route 2 goes to south. It crosses the river too and passes the south of the housing, then it goes through the farmland before it join the A12.

Band 7

200 words

Clear overview comparing the routes · each route traced logically · good use of contrast and sequencing · appropriate vocabulary (curve, cut through, rejoin) · mostly accurate with a minor slip.

The map illustrates two proposed routes for a bypass around the town of Hadley. Overall, both routes would leave the A12 to the west of the town and rejoin it to the east, but Route 1 would pass to the north, near the school and through woodland, whereas Route 2 would run to the south, crossing farmland.

At present, the A12 enters Hadley from the west and continues through the town centre before leaving towards the east. The centre is surrounded by housing to the north and south, while the River Hale flows from north to south to the west of the town. A school is located in the north-west, with woodland in the north-east and farmland in the south-east.

Route 1 would curve northwards from the A12, passing close to the school, before crossing the river and running along the northern edge of the map, beyond the housing. It would then cut through the northern part of the woodland before turning south to meet the A12.

Route 2, by contrast, would head south-east, cross the river and pass well to the south of the housing. In the east, it would cut across the farmland before rejoining with the A12.

Band 8

207 words

Sharp overview highlighting the key trade-off · both routes traced with precise reference to landmarks · sophisticated cohesion · accurate, wide vocabulary (skirting, fringe, mirror-image) · varied structures, error-free.

The map shows the town of Hadley together with two alternative routes proposed for a bypass. Both routes would divert traffic from the A12 around the town, branching off to the west and rejoining it to the east; the key difference is that the northern option would affect the school and the woodland, while the southern option would cross farmland.

Currently, the A12 runs directly through Hadley town centre from west to east. The centre is flanked by housing to the north and south, and the River Hale flows southwards to the west of the town. The surrounding area contains a school in the north-west, woodland in the north-east and farmland in the south-east.

Route 1 would swing north from the A12, skirting the school closely on its western side, then cross the river and run parallel to the northern boundary of the map, well beyond the housing. It would subsequently cut through the northern fringe of the woodland before descending to meet the A12 east of the town.

Route 2 would follow a mirror-image course to the south. After crossing the river, it would pass some distance south of the housing and then bisect the farmland in the south-east before looping north to rejoin the A12.

Riverside district, 1990

id wb1_map_20

The maps below show a riverside district of a city in 1990 and 2025.

**Band 6**

176 words

Overview present but general · all key changes covered · mechanical linking (Also, In addition) · adequate vocabulary · several errors in articles, agreement and tense that do not affect understanding.

The maps show a riverside district of a city in 1990 and 2025. Overall, the district changed from an industrial area to a area for living, working and leisure, and some new paths was built.

In 1990, the River Tane went through the middle of the district from west to east, and Old Bridge crossed it on the east side. To the north of the river there was a factory, some warehouses and wasteland. To the south there were terraced housing and a power station, and the south-east was empty.

In 2025, the factory has been converted to apartments and the warehouses were replaced by offices. The wasteland became a riverside park. On the south side, the terraced housing is still there, but the power station is now an arts centre. Also, a car park has been built in the south-east. In addition, there is a riverside walkway along the north side of the river and a footbridge over the river from the housing to the north side. The roads and Old Bridge stayed the same.

Band 7

196 words

Clear overview · changes organised logically by area · effective cohesion · good vocabulary (converted, business and leisure) · mostly accurate with an agreement slip.

The maps compare a riverside district of a city in 1990 and 2025. Overall, the area has changed from an industrial district into one used for housing, business and leisure, with former industrial buildings either converted or replaced, and new routes created for pedestrians.

The basic road network has remained the same, with North Road and South Road running along the northern and southern edges and Old Bridge crossing the River Tane in the east. The terraced housing in the south-west has also been kept.

North of the river, the factory in the north-west has been converted into apartments, while the warehouses next to it have been replaced by offices. The wasteland in the north-east, on the other side of Old Bridge, has been turned into a riverside park. South of the river, the power station has become an arts centre, and a car park has been built on the empty land in the south-east.

In addition, two new footpaths have appeared. A riverside walkway now runs along the northern bank of the river for its full length, and a footbridge has been constructed across the river, linking the terraced housing area with the north bank.

Band 8

187 words

Insightful overview of regeneration · changes precisely located and logically grouped by bank · cohesion natural and varied · sophisticated vocabulary (derelict, repurposed, fronted by) · wide range of accurate structures.

The maps illustrate the transformation of a city's riverside district between 1990 and 2025. The overall picture is one of post-industrial regeneration: heavy industry and derelict land have given way to homes, workplaces and cultural and leisure facilities, while the district's road network and its residential streets in the south-west have survived unchanged.

On the northern bank of the River Tane, the factory has been converted into apartments, and the neighbouring warehouses have been replaced by an office development. Further east, beyond Old Bridge, the wasteland has been landscaped as a riverside park. These buildings are now fronted by a riverside walkway that follows the northern bank along the whole width of the district.

South of the river, the terraced housing remains in place, but the power station beside it has been repurposed as an arts centre, and the previously undeveloped land to the east of Old Bridge has been turned into a car park. Finally, pedestrian access across the river has been improved by a new footbridge, which links the eastern end of the terraced housing with the northern bank, between the apartments and the offices.

Recycling glass bottles

id wb1_process_01

The diagram below shows how used glass bottles are recycled.

**Band 6**

173 words

Overview present but placed at the end · all stages covered in order · mechanical linking (Firstly, Then, After that) · adequate vocabulary · several agreement and preposition errors that do not block meaning.

The diagram shows the process of recycling the used glass bottles. There are eight stages in this process.

Firstly, people leave their empty bottles in bottle banks in the street. Then a lorry take the bottles to the recycling plant. After that, the bottles are sorted by colour, so clear, green and brown glass are separated. Next, the labels and caps are removed and the bottles is washed with high-pressure water.

In the fifth stage, the glass is crushed into small pieces, which are called cullet. Then the cullet is mix with sand and heated to 1,500°C. After this, the molten glass is shaped to new bottles in the moulding stage. Finally, the new bottles are sent to drinks factories and shops.

Overall, the process starts with the collection of bottles and ends with the distribution of new bottles, and then it begin again from the collection stage, so it is a cycle. The most important part is at the recycling plant where the glass is sorted, cleaned, crushed and melted.

Band 7

186 words

Clear overview stating the cycle and eight stages · logical progression with passive forms · good range of linking · some less common vocabulary · mostly accurate with two minor slips.

The diagram illustrates the way in which used glass bottles are recycled so that they can be turned into new ones.

Overall, the process is cyclical and consists of eight stages, beginning with the collection of empty bottles from street bottle banks and ending with the distribution of new bottles, after which the cycle starts again.

To begin with, bottles are left by the public in bottle banks, from where they are taken by lorry to a recycling plant. At the plant, they are sorted according to colour into clear, green and brown glass. The sorted bottles are then cleaned, labels and caps are removed and the glass is washed with high-pressure water.

In the next stage, the glass is crushed into a small pieces known as cullet. This cullet is mixed with sand and heated to a temperature of 1,500°C, and the resulting molten glass is shaped into new bottles in moulds. Finally, these bottles are sent to drinks factories and shops, and the whole process then begins again with the collection stage, meaning that the same glass can be used many times.

Band 8

181 words

Well-placed overview identifying the cycle and its end points · every stage skilfully sequenced · precise vocabulary (deposited, dispatched, cullet) · wide range of passive and participle structures · error-free.

The diagram depicts the stages through which discarded glass bottles pass as they are recycled into new containers.

It is clear that this is a continuous, eight-stage cycle. It begins when empty bottles are deposited in street bottle banks and concludes with newly manufactured bottles being dispatched to retailers, at which point the sequence starts afresh.

Once the bottles have been collected from bottle banks, they are transported by lorry to a recycling plant, where they are sorted into clear, green and brown glass. Each batch is subsequently cleaned, with labels and caps being stripped off before the glass is washed using high-pressure water.

The clean glass is then crushed into small fragments, referred to as cullet. In the melting phase, this cullet is combined with sand and heated to 1,500°C, producing molten glass that is moulded into fresh bottles. In the final stage, the finished bottles are distributed to drinks factories and shops. From there, the bottles eventually find their way back to street bottle banks, completing the loop and allowing the same glass to be reused repeatedly.

Production of olive oil

id wb1_process_02

The diagram below shows the stages in the production of olive oil.

Band 6

169 words

Basic overview given late · all nine stages covered but linking is repetitive (Then, After that) · adequate vocabulary · several article, agreement and preposition errors that never obscure meaning.

The diagram show how olive oil is produced. There are nine stages, from harvesting the olives to using the by-product.

First, olives are harvested between October and December. The olives are shaken from the trees and they fall onto a nets. Then the olives are washed for removing leaves and dirt. After that, the olives and the stones are crushed and they become a paste.

Next step is malaxation, the paste is stirred slowly for 30-40 minutes. Then a centrifuge separate the oil from water and solids. After this, the oil is left in steel tanks for 4-6 weeks to settle. Then it is filtered, so the particles which remain are removed. After filtering, the oil is sealed in dark glass bottles.

Finally, the pulp which is left over is dried and burned as a fuel. Overall, it is a linear process with many steps and some of them take long time, especially the settling in the tanks, and even the waste is used in the end.

Band 7

178 words

Clear overview of stages and outcome · logical sequencing with varied linkers · some less common vocabulary (undergoes, leftover pulp) · mostly error-free sentences with one verb form slip.

The diagram outlines the process by which olive oil is produced, from the harvest to the use of waste material.

Overall, there are nine stages in this linear process. The main product, bottled oil, is obtained at the eighth stage, while the final step involves making use of the leftover pulp. The time needed for the stages ranges from minutes to several weeks.

The process begins between October and December, when olives are shaken from the trees onto nets. They are then washed to remove leaves and dirt, before both the olives and their stones are ground into a paste. This paste undergoes malaxation, meaning it is slowly stirred for 30 to 40 minutes, after which a centrifuge is used to separate the oil from water and solids.

Following this, the oil is left to rest in steel tanks for between four and six weeks. Any remaining particles are then filtered out, and the oil is sealed in dark glass bottles. Finally, the leftover pulp is dried and burn as fuel, which means that very little is wasted.

Band 8

186 words

Skilful overview highlighting start, product and by-product · figures used selectively for comparison · precise technical vocabulary · wide range of passive and participle structures · no noticeable errors.

The diagram illustrates the sequence of steps involved in manufacturing olive oil, from gathering the fruit to disposing of the residue.

In total, the process comprises nine linear stages. It starts with the seasonal harvest and culminates in bottling, with a final step in which the waste pulp is recovered as a source of energy.

Harvesting takes place from October to December, when the olives are shaken from the trees and caught in nets. After being washed to clear away leaves and dirt, the fruit is crushed, stones included, into a paste. This paste is then subjected to malaxation, a slow stirring phase lasting 30–40 minutes, before being fed into a centrifuge, which separates the oil from water and solid matter.

The extracted oil is subsequently left to settle in steel tanks for four to six weeks, a considerably longer period than the stirring phase, and is then filtered to eliminate any remaining particles. Once clarified, it is sealed in dark glass bottles. Meanwhile, the pulp left over from production is dried and burned as fuel, ensuring that the by-product is put to good use.

☐ Approved ☐ Needs changes Notes:

Life cycle of the honeybee

id wb1_process_03

The diagram below shows the life cycle of the honeybee.

Band 6

177 words

Overview placed late and basic · all stages and timings covered in order · repetitive linking · adequate but plain vocabulary · several agreement and article errors that do not affect understanding.

The diagram illustrate the life cycle of the honeybee. It have six stages and it is a cycle.

At the beginning, the queen lays an egg in a wax cell. After 3 days the egg hatches and becomes a larva. The larva is fed royal jelly at first and then pollen and honey, and this stage is 6 days. Then the worker bees seal the cell with a wax.

After that the larva is a pupa. In this stage it develop legs, wings and eyes, and it takes about 12 days. On day 21 the adult bee chews through the wax cap and comes out of the cell.

Finally, the adult becomes a worker bee. The worker bee cleans, feeds larvae and later it collects nectar. It lives for 5-6 weeks. Then the cycle start again with a new egg from the queen.

Overall, the honeybee has six stages from egg to worker bee, and the development inside the cell take 21 days in total, which is much shorter than the life of the worker bee.

Band 7

182 words

Clear overview with the key timing · stages logically sequenced with good cohesion · some less common vocabulary (emerges, capped cell) · frequent error-free sentences with one agreement slip.

The diagram shows the various stages in the life of a honeybee, from the moment an egg is laid until the bee becomes a working member of the colony.

Overall, the life cycle consists of six stages and is cyclical. It takes 21 days for an egg to develop into an adult, while the adult worker bee lives for only a few weeks.

The cycle begins when the queen lays an egg in a wax cell. After three days, the egg hatches into a larva, which is fed on royal jelly at first and later on pollen and honey for a period of six days. At the end of this stage, worker bees seal the cell with wax.

Inside the capped cell, the larva develops into a pupa, growing legs, wings and eyes over approximately 12 days. On day 21, the adult bee emerges by chewing through the wax cap. It then becomes a worker bee, which cleans, feeds larvae and eventually collect nectar. Worker bees live for five to six weeks, and new eggs laid by the queen continue the cycle.

Band 8

186 words

Well-judged overview contrasting development time and adult lifespan · timings selected accurately · cohesion managed seamlessly · precise vocabulary (deposits, pupal stage) · varied complex structures · error-free.

The diagram charts the development of the honeybee through the six stages of its life cycle, which begins with an egg and ends with a mature worker bee.

It is evident that the entire transformation from egg to adult is completed within 21 days, much of it inside a sealed wax cell, whereas the adult worker survives for just five to six weeks before the cycle begins anew with fresh eggs.

Initially, the queen deposits an egg in a wax cell, and three days later this hatches into a larva. For the following six days, the larva is fed first on royal jelly and subsequently on pollen and honey, after which worker bees cap the cell with wax.

Sealed within, the insect enters the pupal stage, lasting about 12 days, during which it develops legs, wings and eyes. On day 21, the fully formed adult chews its way out through the wax cap. It then takes on the role of a worker bee, initially cleaning and feeding larvae before progressing to collecting nectar. As new eggs are laid by the queen, the cycle is repeated continuously.

☐ Approved ☐ Needs changes Notes:

Producing drinking water from seawater

id wb1_process_04

The diagram below shows how drinking water is produced from seawater at a desalination plant.

Band 6 169 words

Overview present but late and simple · all eight stages covered in sequence · mechanical linking · adequate vocabulary with repetition · several agreement errors and a comma splice that do not block meaning.

The diagram shows how the seawater is changed into drinking water in a desalination plant. There are eight steps in the process.

Firstly, seawater is drawn in through a pipe which have a screen. Then in the pre-treatment stage, sand filters remove particles and algae from the water. After that a high-pressure pump pressurise the water to about 60 bar.

Next, the water goes to reverse osmosis. In this stage, membranes separates the fresh water and the salt. The salty waste, which is called brine, is diluted and it is returned to the sea. The fresh water continue to the next stage.

After that, calcium and magnesium are added to the water, this is remineralisation. Then a small amount of chlorine is added for disinfection. Finally, the water is stored in a reservoir and then it is piped to homes.

Overall, the process is linear and it starts with seawater and ends with drinking water for homes. The main stage is reverse osmosis because it takes the salt out.

Band 7

177 words

Clear overview naming the key stage · logical progression with passive forms and varied linkers · less common vocabulary (discharged, undergoes) · mostly error-free with two minor slips.

The diagram illustrates the process of producing drinking water from seawater at a desalination plant.

Overall, there are eight stages in this linear process, starting with the intake of seawater and ending with the supply of drinking water to homes. The key stage is reverse osmosis, where salt is removed, and this also produces a waste product that is returned to the sea.

Initially, seawater is drawn in through a screened pipe and passes through sand filters, which remove particles and algae. The water is then pressurised to about 60 bar by a high-pressure pump before it is forced into the reverse osmosis unit. Here, membranes separate the fresh water from the salt.

At this point, the salty waste, known as brine, is diluted and discharged back into the sea. Meanwhile, the fresh water undergoes remineralisation, in which calcium and magnesium is added. After that, it is disinfected with a small amount of chlorine. In final stage, the treated water is kept in a reservoir and later piped to households, where it can be used for drinking.

Band 8

182 words

Precise overview identifying the pivotal stage and its two outputs · every stage covered fluently · wide, accurate vocabulary (potable, remineralised) · sophisticated passive and relative structures · error-free.

The diagram explains how seawater is converted into potable water at a desalination facility.

In essence, the treatment follows eight consecutive stages, from the intake of raw seawater to the delivery of drinking water to homes. At the heart of the process lies reverse osmosis, which splits the flow into fresh water for further treatment and salty waste that is discharged.

To begin with, seawater is drawn into the plant through a screened pipe, after which it is pre-treated using sand filters that trap particles and algae. A high-pressure pump then raises the pressure of the water to approximately 60 bar, enabling it to pass through reverse osmosis membranes, where the fresh water is separated from the salt.

The resulting salty waste is diluted and returned to the sea. The desalinated water, by contrast, is remineralised through the addition of calcium and magnesium, before being disinfected with a small quantity of chlorine. Finally, the treated water is held in a storage reservoir, from which it is piped to residential properties, completing its transformation from seawater into a safe supply for household consumption.

☐ Approved ☐ Needs changes Notes:

Manufacturing paper from wood

id wb1_process_05

The diagram below shows how paper is made from wood.

Band 6 174 words

Overview given early but basic · all eight stages described in order · mechanical sequencing (Then, After that, Next) · adequate vocabulary · several agreement and article errors that do not block meaning.

The diagram shows the process of making paper from the wood. Overall, there is eight stages and it start with cutting trees and finish with cutting the paper to size.

First, softwood trees are cut down in managed forests. Then the bark is removed from the logs and the logs are cut into small chips. After that, the chips are cooked with chemicals, so the fibres are separated. This stage is called pulping. Next, the pulp is bleached to make it white.

In the fifth stage, the pulp is mixed with water and also with recycled fibre. Then the mixture is sprayed on a moving mesh and the water drain away, so a sheet is formed. After that, the sheet is pressed between rollers and it is dried over heated cylinders.

Finally, the paper is wound onto a large reels and then it is cut to size. In general, the process has many steps and the paper is made from trees and also from recycled fibre, which is added in the middle of process.

Band 7 179 words

Clear overview grouping the stages · logical progression with good use of passives and sequencers · some less common vocabulary (debarked, resulting sheet) · mostly accurate with two minor slips.

The diagram illustrates how paper is manufactured from wood, from the felling of trees to the production of finished sheets.

Overall, there are eight stages in this linear process, which begins in the forest and ends with paper ready for use. The first two stages prepare the raw timber, the middle stages turn it into pulp, and the final stages form, dry and cut the paper.

At the start, softwood trees are cut down in the managed forests. The logs are then debarked and cut into chips, which is subsequently cooked with chemicals in order to separate the fibres, a stage which is known as pulping. This pulp is bleached to make it whiter, and then it is mixed with water and recycled fibre.

In the forming stage, the mixture is sprayed onto a moving mesh, allowing the water to drain away. The resulting sheet is pressed between rollers and dried as it passes over a set of heated cylinders. Finally, the paper is wound onto large reels before being cut to the required size, which completes the process.

Band 8

189 words

Insightful overview grouping the stages into three phases · every stage covered with precise sequencing · wide, accurate vocabulary (felled, stripped away, reduced to chips) · varied complex structures · error-free.

The diagram sets out the eight stages involved in converting timber into paper.

Broadly speaking, the process falls into three phases: the preparation of the raw wood, the chemical treatment of that wood to create pulp, and the mechanical formation of the paper itself. It begins in managed forests and ends with the paper being reeled and trimmed to size. Notably, recycled fibre is introduced part-way through, so the finished product is not made from newly felled wood alone.

Initially, softwood trees are felled, after which their bark is stripped away and the logs are reduced to chips. These chips are then cooked with chemicals, a step known as pulping, which separates the wood fibres. The resulting pulp is bleached to whiten it and subsequently combined with water and recycled fibre.

At the forming stage, this mixture is sprayed onto a moving mesh, through which the water drains, leaving a damp sheet behind. The sheet is then pressed between rollers and dried over a series of heated cylinders. In the last step, the finished paper is wound onto large reels and later cut into sheets of the required dimensions.

Pumped-storage hydroelectricity

id wb1_process_06

The diagram below shows how a pumped-storage hydroelectric power station works.

Band 6

164 words

Relevant overview but placed at the end · stages covered in order with basic day/night contrast · repetitive linking · adequate vocabulary · several agreement and preposition errors that do not obscure meaning.

The diagram shows how a pumped-storage hydroelectric power station work. There are eight stages and they make a cycle, which happen every day and night.

At night, the demand for electricity is low, so the station takes the cheap surplus electricity from the grid. This electricity is used for pumping the water from the lower reservoir up to a tunnel. Then the water is stored in the upper reservoir on the top of the mountain.

During the day, the demand is high, so the valves are opened. After that the water is released and it flows down through the tunnel. Next, the falling water spin the turbines, which are connected to generators. Then the power is sent to the national grid.

Finally, the water is collected in the lower reservoir and it is ready to be pumped again at the next night. Overall, the station uses electricity at night and produces electricity in the day, and the same water is use again and again.

Band 7

193 words

Clear overview highlighting the night and day contrast · logical progression with varied cohesive devices · good collocations (surplus electricity, meet demand) · frequent error-free sentences with two minor slips.

The diagram illustrates the operation of a pumped-storage hydroelectric power station, which moves water between two reservoirs in order to meet changes in demand for electricity.

Overall, the process is cyclical and has eight stages. The key point is that the station uses electricity at night, when demand is low, and generates electricity during the day, when demand is high. In addition, the same water is used again and again.

At night, cheap surplus electricity is taken from grid and used to pump water from a lower reservoir up a tunnel to an upper reservoir, where it is stored at the top of a mountain. As a result, a large volume of water is kept high above the turbines, ready to be used later.

During the day, when there is greater demand for power, valves are opened and the water is released. It flows down through the tunnel, and the falling water spins turbines that are connected to generators. The electricity produced is then sent to the national grid. Finally, the water collects in the lower reservoir, where it remains until it is pumped back up again, and so the cycle repeat itself.

Band 8

194 words

Skilful overview contrasting the two operating modes · stages sequenced seamlessly with a clear return to the start · precise vocabulary (surplus, drawn from the grid) · wide range of complex structures · error-free.

The diagram explains how a pumped-storage hydroelectric plant functions over a cycle of night and day, using the same body of water repeatedly.

In essence, the system consists of eight repeating stages and operates in two distinct modes: during periods of low demand at night it consumes electricity to move water uphill, whereas during periods of high demand in the daytime it releases that water to generate power.

At night, inexpensive surplus electricity is drawn from the grid and used to pump water from the lower reservoir up through a tunnel. The water is then held in an upper reservoir on the mountain top, where it waits until it is needed. Crucially, this pumping phase relies on electricity at a time when it is both cheap and plentiful.

Once demand rises during the day, valves are opened and the water is allowed to flow back down the tunnel. As it falls, it drives turbines linked to generators, and the electricity this produces is fed into the national grid. The water then collects in the lower reservoir, where it remains until it can be pumped up once more, at which point the entire cycle resumes.

Rainwater harvesting in a house

id wb1_process_07

The diagram below shows how rainwater is collected and used in a house.

Band 6 179 words

Overview present but late and simple · all seven stages covered in order · mechanical linking and some repetition · adequate vocabulary · several article and agreement errors that do not block meaning.

The diagram shows how the rainwater is collected and used in a house. There are seven stages in the process. The diagram have a picture of a house with a garden and a tank under it.

Firstly, rain falls on the roof of the house and runs off the roof surface. Then the water goes into the gutters and the downpipe, which channel it from the edge of roof. After that, the water pass through a leaf filter, so leaves and debris are removed.

Next, the filtered water is stored in a underground tank. The tank is below the garden. When the house needs water, a pump sends the water into the house. The water is used for toilets, washing machine and for watering the garden.

Finally, when the tank is full, the extra water drains to a soakaway. This is the last stage in the diagram. Overall, the process starts with rain on the roof and ends with using the water in the house, and there is also a overflow for the water that the tank cannot keep.

Band 7 188 words

Clear overview identifying start, main use and overflow · logical sequencing with passive forms · some less common vocabulary (channelled, debris) · mostly error-free with two minor slips.

The diagram explains how rainwater is collected from the roof of a house and then used inside the building and in the garden.

Overall, the system involves seven stages, beginning with rainfall on the roof and leading to household use of the stored water. There is also an overflow, which deals with excess water when the tank is full, and the underground tank acts as the central point between collection and use.

First, rain runs off the surface of the roof and is channelled from the roof edge by gutters into a downpipe. The water then passes through a leaf filter, where leaves and other debris are removed, before it is stored in a underground tank located beneath the garden.

When water is needed, it is pumped from the tank into the house. This means that the tank only supplies water to the house when it is actually required. There, it is used for three main purposes: flushing toilets, running the washing machine and watering the garden. Finally, if the tank becomes full, any excess water is drained away to a soakaway rather than stay in the system.

Band 8

177 words

Well-placed overview covering the main route and overflow · stages logically and fluently linked · precise vocabulary (culminating, capacity, retained) · wide range of structures including inversion · error-free.

The diagram depicts a domestic rainwater harvesting system, showing how rain falling on a house is captured, filtered, stored and eventually put to use.

The process consists of seven stages, starting with rainfall on the roof and culminating in the use of the water within the household, while a separate overflow route handles any surplus once the storage tank has reached capacity.

Rain initially runs off the roof surface and is channelled from its edge into gutters and a downpipe. From there, it passes through a leaf filter designed to trap leaves and debris, and the filtered water is then stored in an underground tank buried beneath the garden.

Whenever water is required, it is pumped from this tank into the house, where it serves three purposes: flushing toilets, supplying the washing machine and watering the garden. Should the tank become full, however, the excess water is not retained; instead, it drains away to a soakaway. In this way, the system both makes use of rainwater and prevents surplus water from building up once storage is exhausted.

Making hard cheese

id wb1_process_08

The diagram below shows the process of making hard cheese.

Band 6 170 words

Basic overview split between start and end · stages and figures reported accurately · mechanical linking · adequate vocabulary · agreement errors and a comma splice that do not block meaning.

The diagram shows the process of making hard cheese. There are eight stage, from collecting milk to packaging.

Firstly, fresh milk is delivered from dairy farms. Then the milk is pasteurised, it is heated to 72°C for 15 seconds and then cooled. After that, culture and rennet are added to the milk and it begin to set.

Next, the milk separate into solid curd and liquid whey. Then the curd is cut into cubes and heated, and the whey is drained off. After this, the curd is salted and it is pressed into the moulds.

In the ripening stage, the cheese is stored at 10°C for 3–24 months. This is the longest stage in the process. Finally, the cheese is cut, wrapped and labelled, so it can be sold in the shops.

Overall, making hard cheese is a linear process with many steps. The milk become cheese through heating, cutting, salting and a long time of ripening, and this is why it takes a lot of time.

Band 7 196 words

Clear overview with the key feature highlighted · figures accurate and well integrated · logical progression with passive forms · less common vocabulary (pasteurised, ripen) · one grammar slip.

The diagram illustrates the various stages involved in the production of hard cheese.

Overall, it is a linear process consisting of eight stages, starting with the collection of fresh milk and finishing with the packaging of the cheese. The ripening stage is by far the longest, lasting up to two years, while pasteurisation takes only a few seconds. The whole process, therefore, can take a long time to complete.

To begin with, milk is delivered from dairy farms and pasteurised, which involves heating it to 72°C for 15 seconds before it is cooled. Culture and rennet are then added, causing the milk begin to set, and it soon separates into solid curd and liquid whey.

After this, the curd is cut into cubes and heated, while the whey is drained off. This means that the curd, rather than the whey, is used to make the cheese. The curd is then salted and pressed into moulds. Next, the cheese is left to ripen at a temperature of 10°C for a period of between 3 and 24 months. In the final stage, it is cut, wrapped and labelled so that it is ready to be sold.

Band 8

193 words

Skilfully selected overview contrasting stage durations · figures used precisely for comparison · cohesion managed well · precise vocabulary (prompting, time-consuming) · wide range of structures, error-free.

The diagram outlines the sequence of steps by which fresh milk is transformed into packaged hard cheese.

There are eight stages in total, beginning with the delivery of milk and ending with packaging, and it combines heating, cutting and pressing with a long period of controlled storage. Of the stages for which a duration is given, ripening is by far the most time-consuming, lasting anywhere from three months to two years, whereas pasteurisation takes a matter of seconds.

Initially, milk is transported from dairy farms, after which it is pasteurised by being heated to 72°C for just 15 seconds and then cooled. Culture and rennet are subsequently introduced, prompting the milk to set, and it separates into solid curd and liquid whey.

The curd is next cut into cubes and heated, and the whey is drained off, so that only the solid part is carried forward. It is then salted and pressed into moulds. Following this, the cheese is ripened at a cool 10°C for between 3 and 24 months. Finally, it is cut, wrapped and labelled for sale, at which point the product is ready to leave the production line.

Publishing a new book

id wb1_process_09

The diagram below shows the stages involved in publishing a new book.

Band 6

185 words

Overview present though basic and repeated at the end · all stages including the rejection route covered · mechanical linking · adequate vocabulary · agreement errors and comma splices that do not block meaning.

The diagram shows the steps for publishing a new book. There are eight steps and it starts when the manuscript is sent and it finishes when the books are in the shops.

Firstly, the author or their agent send the text of the book to a publisher. Then an editor looks at the manuscript and decides about it. If the manuscript is rejected, it is returned to the author and the process stops there. If it is accepted, a contract is signed and the fees and deadlines are agreed.

After that, the book is edited, the structure and the language are revised with the author. Next, the cover is designed and the pages are laid out, this is called design and typesetting. Then the book is proofread and the final errors are corrected.

When this is finished, the books are printed and bound. Finally, the books are sent to shops and online retailers for marketing and distribution.

Overall, publishing a book is a process with many different steps, and not every manuscript can be published because some of them are rejected in the assessment stage.

Band 7

184 words

Clear overview noting the rejection point · stages logically sequenced with a good range of linkers · appropriate vocabulary (submits, laid out, bound) · mostly error-free with one agreement slip.

The diagram outlines the process that a new book goes through, from the moment the manuscript is submitted until the finished books are distributed.

Overall, there are eight stages in the process. It is mostly linear, although at the assessment stage some manuscripts are rejected and sent back to the author, in which case they go no further.

At the beginning, the author or an agent submits the text to a publisher, where an editor assess it. Manuscripts that are rejected are returned, whereas those that are accepted move on to the contract stage, at which fees and deadlines are agreed. The text is then edited, with the author working together with the publisher to revise its structure and language.

Once editing is complete, the cover is designed and the pages are laid out in the design and typesetting stage. This is followed by proofreading, during which any final errors are corrected, so that the text is ready to be printed. The books are then printed and bound, and in the last stage they are marketed and distributed to both shops and online retailers.

Band 8

182 words

Well-placed overview identifying the single decision point · every stage covered with fluent sequencing · precise vocabulary (in collaboration with, dispatched) · wide range of passive and participle structures · error-free.

The diagram illustrates the eight stages through which a new book passes on its way from the author's desk to the retailer.

The process is essentially linear, beginning with the submission of a manuscript and concluding with the marketing and distribution of the printed books. Its one decision point comes early on, when an editor at the publisher either accepts the manuscript or returns it to the author.

To begin with, the text is submitted to a publisher either by the author or by an agent. It is then assessed by an editor, and any manuscript that is rejected is sent back, meaning the process ends there. For successful manuscripts, a contract is signed setting out fees and deadlines, after which the editing phase begins, with the structure and language being revised in collaboration with the author.

The book next moves into design and typesetting, where the cover is created and the pages are laid out. Proofreading follows, allowing any remaining errors to be corrected. Finally, the books are printed and bound before being marketed and dispatched to bookshops and online retailers.

Life cycle of the Atlantic salmon

id wb1_process_10

The diagram below shows the life cycle of the Atlantic salmon.

Band 6

183 words

Overview present but placed at the end · all seven stages and timings covered accurately · repetitive linking · simple vocabulary with some informality · several agreement and article errors that do not block meaning.

The diagram shows the life cycle of the Atlantic salmon. There are seven stages and it is a cycle, because the adult salmon come back to the river where they was born.

Firstly, the eggs are laid in the gravel of the upper river and they hatch in spring. Then the baby fish are called alevin. They stay in the gravel and they feed on their yolk sac. After that, they become fry and they come out from the gravel to feed in the river.

Next stage is parr. The parr live in the river for 1-3 years. Then they become smolt, they turn silver and swim downstream to the sea. In the sea, the adult salmon feed and grow for 1-4 years, so they spend quite a long time there.

Finally, the salmon swim back up the same river to spawn, so the new eggs are laid and the cycle start again. Overall, the salmon spend some years in the river and some years in the sea, and in the end they return to the place where the cycle begin.

Band 7

186 words

Clear overview contrasting river and ocean phases · logical progression with varied cohesive devices · good topic vocabulary (spawn, migrate, emerge) · frequent error-free sentences with one preposition slip.

The diagram illustrates the life cycle of the Atlantic salmon, which is spent partly in a river and partly in the ocean.

Overall, the cycle consists of seven stages. The first four take place in the river, after which the fish migrate to the sea to mature before returning to the same river to spawn, so that the cycle begins again.

The eggs are laid in the gravel of the upper river and hatch in spring. The young fish, known as alevin, remain in the gravel at first and feed on their yolk sac. They then emerge as fry to feed in the river, and later develop into parr, which live in the river for between one and three years.

At the smolt stage, the fish turn silver and migrate downstream to the sea. As adults, they feed and grow in the ocean during 1–4 years. Finally, they make a return migration, swimming back up the same river in which they hatched in order to spawn, and new eggs are laid in the gravel of the upper river, which starts the whole cycle once again.

Band 8

183 words

Perceptive overview contrasting the freshwater and marine phases · stages and durations selected accurately · seamless cohesion · precise vocabulary (sustained by, undertaking) · wide range of structures · error-free.

The diagram traces the life cycle of the Atlantic salmon across seven stages, from eggs laid in a river to mature adults returning to breed.

What stands out is that the fish spends its early life in fresh water and its adult life at sea, before a return migration to the river where it began brings the cycle full circle.

The cycle begins in the gravel of the upper river, where eggs are laid and hatch in spring. The newly hatched alevin remain in the gravel, sustained by their yolk sac, until they emerge as fry to feed in the river itself. They then develop into parr, a stage that lasts anywhere from one to three years.

Subsequently, the young salmon undergo a transformation into smolt, turning silver and migrating downstream to the sea. They spend the next 1–4 years in the ocean, feeding and growing, before undertaking the return migration, swimming back up the very river in which they began life in order to spawn. The eggs they lay mark the start of a new generation, and so the cycle repeats.

Producing cement and concrete

id wb1_process_11

The diagram below shows how cement is produced and then used to make concrete.

Band 6

185 words

Overview at the end but identifies two parts · stages and percentages accurate · mechanical linking · adequate vocabulary · verb form and agreement errors plus a comma splice, meaning always clear.

The diagram shows how cement is produced and how it is used for making concrete. There are eight stages in the process.

First, limestone and clay are extracted from a quarry. Then the raw materials are crushed and mixed together. After that, the mixture is grinded into a fine powder. Next, the powder is heated in a rotating kiln to 1,450°C and it form clinker.

In the fifth stage, the clinker is cooled and grinded with gypsum, and this make cement. Then the cement is packed in bags, so it is ready to use.

After that, the cement is used to make a concrete. The concrete is made from 15% cement, 10% water, 25% sand and 50% gravel, so the gravel is the biggest part of the mixture. Finally, the concrete is poured into moulds and it is left to harden.

Overall, the process has two parts, the first part is producing cement and the second part is making concrete. It is interesting that the cement is only a small part of the concrete, although most of the stages are for making it.

Band 7

187 words

Clear overview dividing the process into two parts · proportions accurately compared · logical progression with passives · some less common vocabulary (accounts for, proportion) · one minor verb form slip.

The diagram illustrates the stages involved in manufacturing cement and the way in which this cement is then used to produce concrete.

Overall, the process has eight stages and can be divided into two parts: the first six stages concern cement production, while the last two show how concrete is made. It is also noticeable that cement makes up only a small proportion of the concrete.

The process begins with the quarrying of limestone and clay, which are crushed and mixed before being ground into a fine powder. This powder is heated to 1,450°C in a rotating kiln, forming a material called clinker. After it has cooled, the clinker is ground with gypsum to produce cement, which is then packed into bags.

To make concrete, the cement is combined with water, sand and gravel. Gravel accounts for the largest share at 50%, followed by sand at 25%, cement at 15% and water at 10%. In other words, gravel and sand together make up three quarters of the mixture. Finally, the concrete is poured into moulds, where it is leaving to harden into its final shape.

Band 8

182 words

Insightful overview linking cement production to its small share in concrete · figures used selectively and compared accurately · cohesion well managed · precise vocabulary · wide range of structures, error-free.

The diagram depicts the production of cement from raw materials and its subsequent use as an ingredient in concrete.

In total, there are eight stages, the first six of which relate to cement manufacture and the final two to the making of concrete. A striking feature is that cement, despite being the focus of most of the process, forms only a modest share of the finished concrete, which consists mainly of gravel and sand.

The raw materials, limestone and clay, are first quarried and then crushed and blended together. This mixture is ground into a fine powder and fed into a rotating kiln, where it is heated to 1,450°C to form clinker. Once cooled, the clinker is ground again, this time with gypsum, to produce cement, which is packed into bags.

In the concrete-making stage, the cement is combined with sand, gravel and water in fixed proportions. Gravel constitutes half of the mix and sand a quarter, while cement and water account for just 15% and 10% respectively. The concrete is then poured into moulds and left to set hard.

☐ Approved ☐ Needs changes Notes:

Producing ethanol fuel from sugar cane

id wb1_process_12

The diagram below shows how ethanol fuel is produced from sugar cane.

Band 6

180 words

Overview placed at the end but relevant · all stages covered with accurate timing · mechanical linking · adequate vocabulary with repetition · word form, agreement and comma splice errors that do not block meaning.

The diagram shows how ethanol fuel is produced from sugar cane. There are eight stages in this process, from growing sugar cane to deliver the fuel.

Firstly, the sugar cane is grown for 12-18 months. When it is ready, the cane is harvested and cut by a machine. Then it is crushed by rollers and the juice is extracted from it.

The waste from the crushing, which is called bagasse, is fibrous. This waste is burned and it gives the power to the factory, so the factory use its own waste. Meanwhile, yeast is added to the juice and the sugar turns into alcohol, this is fermentation.

After that, in distillation stage, the ethanol is separated from the water. Then the ethanol is mixed with petrol, it is called blending. Finally, the fuel is delivered to the filling stations, where people can buy it.

Overall, the process takes a long time because the sugar cane need more than one year to grow. The main product is ethanol fuel and also the waste bagasse is used to power the factory.

Band 7

191 words

Clear overview highlighting the use of waste · logical sequencing with a range of linking expressions · less common vocabulary (bagasse, blended, distillation) · mostly accurate with one minor slip.

The diagram illustrates the process by which sugar cane is turned into ethanol, which is then used as a fuel.

Overall, there are eight stages in the process, beginning with the growing of sugar cane and ending with the delivery of fuel to filling stations. A notable feature is that the fibrous waste produced during the process is used to supply energy to the factory itself. The growing stage is the longest, lasting more than a year in some cases.

Initially, sugar cane is grown for between 12 and 18 months before being harvested by machine. The cane is then crushed by rollers in order to extract the juice. The fibrous waste left over, known as bagasse, is not thrown away but is burned to power the factory. This means that the factory makes use of its own waste.

The juice goes through fermentation, during which yeast is added and the sugar is turned into alcohol. This is followed by distillation, where ethanol is separated from water. Next, the ethanol is blended with petrol to produce the final fuel, and in the last stage this fuel is delivered to filling station.

Band 8

182 words

Skilful overview framing the process in three phases and noting the by-product · stages sequenced fluently · precise vocabulary (residue, cultivated, forecourt) · wide range of structures · error-free.

The diagram sets out the eight stages involved in converting sugar cane into ethanol fuel.

Broadly, the process moves from agriculture to industrial processing and finally to distribution. One noteworthy aspect is that a by-product is put to use: the fibrous waste generated when the cane is crushed is burned to provide the energy that powers the factory. Only the growing stage is given a duration, and at up to a year and a half it clearly dominates the overall timescale.

The cane is cultivated for a lengthy period of 12–18 months before being harvested mechanically. It is then passed through rollers, which extract the juice, leaving behind the fibrous residue known as bagasse; rather than being discarded, this is burned as fuel for the plant.

The extracted juice subsequently undergoes fermentation, with yeast being added so that the sugar is converted into alcohol. Distillation then separates the ethanol from the water it contains, after which the ethanol is blended with petrol. In the final stage, the finished fuel is transported to filling stations, completing the journey from field to forecourt.

Processing university applications

id wb1_process_13

The flow chart below shows how applications to an undergraduate university course are processed.

Band 6 180 words

Overview present but basic and placed last · every stage and outcome covered in order · mechanical linking · adequate vocabulary · several agreement, article and preposition errors that never block meaning.

The flow chart shows how the applications for an undergraduate course in university are processed. There are eight steps from applying online to the enrolment.

Firstly, the student submit an online form with their grades and a personal statement. Then there is an eligibility check. If the application is not complete, it is returned to the student for correction. After that, the tutors review the application and give it a score.

Next, the applicants who are shortlisted are invited to an interview, which can be online or on campus. After the interview, the university make a decision. The student can get an offer, or be on the waiting list, or be rejected.

If the student has an offer, they accept it by confirming the place and paying a deposit. Then the final exam grades are checked against the offer. Finally, the student enrolls and receives an ID card.

Overall, the process starts with the online application and finish with enrolment, and there are some points where the student cannot continue, for example if the application is rejected after the interview.

Band 7

182 words

Clear overview noting the points where applicants may not progress · logical sequencing with varied linkers · appropriate vocabulary (shortlisted, eligibility) · mostly error-free with one article slip.

The flow chart illustrates the procedure followed when students apply for an undergraduate course at university.

Overall, the process consists of eight stages, beginning with an online application and ending with enrolment. There are several points at which an applicant may not progress directly, since incomplete applications are returned and not every applicant receives an offer after the interview.

First, the student submits an online form together with their grades and a personal statement. The application is then checked for eligibility, and any incomplete ones are sent back to be corrected. Following this, tutors review and score each application, and those applicants who are shortlisted are invited to a interview, either online or on campus.

A decision is made after the interview: the applicant receives an offer, is placed on a waiting list or is rejected. Successful students accept the offer by confirming their place and paying a deposit. Later, their final exam grades are checked against the conditions of the offer. In the last stage, the student registers at the university and is given an ID card, which completes the process.

Band 8

191 words

Skilful overview highlighting the filtering points · all stages and branches covered with precise sequencing · wide vocabulary (initiated, comprising, filtering) · varied complex passive structures · error-free.

The flow chart outlines how applications for undergraduate university courses are handled, from initial submission to final enrolment.

The procedure comprises eight stages and, although it is broadly linear, it contains several filtering points at which applicants may be returned, held back or turned down. Only those who satisfy each requirement ultimately enrol and receive a student ID card.

The process is initiated when a student submits an online application comprising their grades and a personal statement. This undergoes an eligibility check, with incomplete submissions being returned for correction. Eligible applications are then scored by tutors in an academic review, the first point at which the content of the application itself is judged, and shortlisted candidates are invited to an interview, which may take place online or on campus.

Following the interview, a decision is reached, with the applicant being made an offer, placed on a waiting list or rejected. Those who accept an offer confirm their place and pay a deposit, after which their final examination grades are checked against the terms of the offer. Once these are confirmed, the student enrolls formally and is issued with an ID card.

Composting household food waste

id wb1_process_14

The diagram below shows how household food waste is turned into compost.

Band 6

176 words

Basic overview at the end · all stages and timings covered in order · mechanical linking · repetitive vocabulary · agreement, word form and comma splice errors that do not impede meaning.

The diagram shows how the food waste from a household is changed into compost. There are seven stages and it is a cycle.

At first, vegetable peelings and food scraps are collected in a kitchen caddy. Then the waste is put in a compost bin in the garden, and leaves and cardboard is added too. After that, the waste is broken down by worms and bacteria, this is decomposition.

Next, the compost is mixed every 2–3 weeks for adding air. This is called turning. Then the compost is left for 6–12 months until it becomes dark and crumbly, so this stage takes the longest time.

When the compost is ready, it is spread on the soil in the garden. Finally, vegetables are grown in the soil and people eat them. The scraps from these vegetables go back to the kitchen caddy, and the cycle start again.

Overall, the process starts and finishes in the kitchen, and the food waste is not wasted because it helps to grow new vegetables which people can eat again.

Band 7

180 words

Clear overview stating the cycle and longest stage · logical progression with a range of cohesive devices · some less common vocabulary (crumbly, mature) · mostly error-free with one agreement slip.

The diagram illustrates the process by which food waste from the home is turned into compost and then used to grow food.

Overall, the process is cyclical and consists of seven stages. It begins and ends in the kitchen, since the scraps from the vegetables that are grown return to the caddy, and the longest stage is maturing, which can take up to a year.

Firstly, vegetable peelings and other food scraps are collected in a kitchen caddy. This waste is then placed in a compost bin in the garden along with leaves and cardboard. Inside the bin, worms and bacteria break the waste down, a stage known as decomposition, and the mixture is turned every two to three weeks so that air is added to it.

After that, the compost is left to mature for between 6 and 12 months until it becomes dark and crumbly. It is then spread on the soil, where vegetables are grown. Once these vegetables have been harvested and eaten, the scraps are returned to the kitchen caddy, and the whole cycle begins again.

Band 8

184 words

Perceptive overview emphasising the circular nature and longest stage · stages linked seamlessly · precise vocabulary (protracted, aerate, decomposing) · wide range of structures · error-free.

The diagram depicts the seven-stage cycle through which household food waste is converted into compost and ultimately helps to produce new food.

The most notable feature of the process is its circular nature: it starts with scraps collected in the kitchen and ends with vegetables whose leftovers return to that same point. Of the individual stages, maturing is by far the most protracted, lasting between six months and a year, far longer than the two- to three-week interval between turnings.

To begin with, peelings and food scraps are gathered in a kitchen caddy before being transferred to a garden compost bin, where they are combined with leaves and cardboard. Worms and bacteria then set about decomposing this material, and the contents of the bin are turned every two to three weeks to aerate them.

Next, the compost is left to mature for 6–12 months, by which time it has become dark and crumbly. It is then spread on the soil and used to grow vegetables, which are eventually eaten. The scraps from these return to the caddy, allowing the cycle to repeat indefinitely.

Producing black tea

id wb1_process_15

The diagram below shows the stages in the production of black tea.

Band 6

175 words

Overview placed at the end and fairly general · all stages and figures covered accurately · repetitive linking · adequate vocabulary · several agreement, article and preposition errors that do not block meaning.

The diagram shows the stages of producing black tea. There is eight stages, from plucking the leaves to packing and exporting.

Firstly, the top two leaves and a bud are picked by hand. Then the leaves are spread on racks for 12-18 hours, this is called withering. After that the leaves are rolled for breaking the cell walls.

Next, the leaves are left for oxidation. In this stage, the colour of leaves change to copper-brown and it takes 1-3 hours. Then the leaves are dried with hot air at 120°C, and this stops the oxidation.

In the sixth stage, the leaves are sieved and sorted by the size. After that, professional tasters check the samples of tea to see if it is good. Finally, the tea is packed in sacks which have foil inside and it is exported.

Overall, black tea production has many stages and some of them take a lot of hours, for example withering. The process starts with picking leaves by hand and ends with export to other countries.

Band 7

184 words

Clear overview grouping early and later stages · figures accurate and compared · logical progression with passive forms · some less common vocabulary (wither, graded) · one minor agreement slip.

The diagram illustrates the process of making black tea, from picking the leaves to packing the finished product.

Overall, there are eight stages in this linear process. The early stages mainly involve changing the physical state of the leaves, while the later ones focus on checking quality and preparing the tea for export. The process begins with hand-picking and ends with the tea being packed for export. Withering is the longest of the stages for which a time is given.

To begin with, the top two leaves and a bud are plucked by hand. They are then spread on racks to wither for 12 to 18 hours, after which they are rolled in order to break the cell walls. During the oxidation stage, the leaves turn a copper-brown colour over a period of one to three hours.

This process is stopped by drying the leaves with hot air at a temperature of 120°C. The dried leaves are then sieved and graded according to size, and samples are checked by professional tasters. Finally, the tea are packed in foil-lined sacks, ready to be exported.

Band 8

185 words

Well-judged overview dividing the process and comparing stage durations · figures used selectively · cohesion managed fluently · precise vocabulary (halted, evaluated) · wide range of structures, error-free.

The diagram charts the eight stages involved in the production of black tea, from harvesting the leaves to preparing them for export.

In broad terms, the first half of the process transforms the fresh leaves, whereas the second half is concerned with quality control and packaging. The process begins with leaves being picked by hand and ends with the finished tea being packed for shipment overseas. Withering, at 12–18 hours, is considerably lengthier than oxidation, which takes only one to three hours.

Production begins with plucking, a delicate task in which the top two leaves and a bud are picked by hand. These are then laid out on racks to wither before being rolled, a step which breaks down their cell walls. The rolled leaves are left to oxidise, gradually turning copper-brown, until this reaction is halted by a stream of hot air at 120°C.

Once dried, the leaves are sieved so that they can be sorted and graded by size. Samples are subsequently evaluated by professional tasters, and in the final stage the tea is packed into foil-lined sacks ready for export.

Recycling plastic bottles into clothing fibre

id wb1_process_16

The diagram below shows how plastic bottles are recycled into polyester fibre for clothing.

Band 6 178 words

Basic overview at the end · all eight stages covered in order with the key figure · mechanical linking · adequate vocabulary · several agreement, article and word form errors that do not block meaning.

The diagram shows the process of recycling plastic bottles to make polyester fibre for clothes. There are eight stages in the process.

First, the bottles are collected from homes. Then they are sorted, and the PET bottles are separated from another plastics. After that, the bottles are washed and the labels and caps is removed. At the end of this stage the bottles are clean.

Next, the bottles are shredded, it means they are cut into small flakes. So the bottles become small pieces of plastic. Then the flakes are melted at 260°C and become liquid. After this, the liquid is pushed through a very tiny holes and it forms threads. This is the extrusion stage.

In the seventh stage, the threads are stretched and they are spun into yarn. Finally, the fabric is made and it is sewed into jackets and T-shirts.

Overall, the process begin with old plastic bottles and ends with new clothes. Most of the stages are about changing the bottles into thread, and only the last stage is about making the clothes.

Band 7

185 words

Clear overview grouping the stages into three phases · logical progression with passives and sequencers · appropriate vocabulary (shredded, extrusion, garments) · mostly error-free with one agreement slip.

The diagram illustrates how used plastic bottles are recycled and turned into polyester fibre, which is then used to make clothing.

Overall, the process consists of eight stages, starting with the collection of bottles from homes and ending with the production of garments such as jackets and T-shirts. The bottles are first prepared, then melted and turned into threads, and finally made into fabric, which shows how a waste product can become the raw material for new goods.

At the beginning, bottles are collected from households and sorted so that PET bottles are separated from other types of plastic. They are then washed, and their labels and caps are removed. Following this, the bottles are shredded into small flakes, which are melted at a temperature of 260°C so that they become liquid.

The liquid plastic is next pushed through tiny holes in the extrusion stage, forming threads. These threads are stretched and spun into yarn, which is the material used for making fabric. In the final stage, fabric is woven from the yarn and sewn into items of clothing, in particular jackets and T-shirts.

Band 8

189 words

Insightful overview tracing the change from waste to fabric · stages sequenced precisely · wide, accurate vocabulary (reprocessed, extruded, penultimate) · varied complex structures · error-free.

The diagram explains how discarded plastic bottles, collected from ordinary households, are reprocessed into polyester fibre and ultimately into clothing.

The process involves eight sequential stages and can be seen as a transformation from solid waste to wearable fabric: the bottles are first prepared and broken down, then melted and reformed into threads, and finally woven and sewn into garments. Notably, the only temperature specified is that of the melting stage, the point at which the bottles lose their original form.

Initially, bottles are collected from households and taken to be sorted, with PET bottles being separated from other plastics, a step that ensures only PET continues through the process. After being washed and stripped of their labels and caps, they are shredded into flakes. These flakes are melted at a temperature of 260°C, and the resulting liquid is extruded, meaning that it is forced through tiny holes to create fine threads.

In the penultimate stage, the threads are stretched and spun into yarn. This yarn is then woven into fabric, which is sewn to produce clothing such as jackets and T-shirts, bringing the process to a close.

Formation of coal

id wb1_process_17

The diagram below shows the stages in the formation of coal.

Band 6 185 words

Overview placed at the end · all stages covered in sequence with the key figure · mechanical linking · adequate vocabulary · repeated agreement errors that do not block meaning.

The diagram shows the stages of how coal is formed. There are eight stages, from the swamp forest to the mining of coal.

In the first stage, plants grow in warm wetlands, which is called swamp forest. Then the plants die and they fall into the water, but they do not decay fully. After that, the layers of dead plants build up and they are compressed, and this become peat.

Next, the peat is covered by sand and mud and this take millions of years. Then the heat and the pressure remove the water from it, so it change into lignite. After more compression, it becomes bituminous coal, which has more carbon than before.

In the seventh stage, the coal become anthracite. This is the hardest coal and it has about 90% of carbon. Finally, people extract the coal from underground seams by mining, so it can be used.

Overall, the process is very long and it starts with living plants and ends with hard coal which is mined from under the ground. The coal has more carbon in the later stages of the process.

Band 7

184 words

Clear overview of timescale and main change · logical progression with cause and sequence linkers · good topic vocabulary (debris, compressed, carbon content) · mostly error-free with one agreement slip.

The diagram illustrates how coal is formed over time, beginning with plants in swamp forests and ending with the extraction of coal from the ground.

Overall, there are eight stages in the process, which takes millions of years. As the material is buried and compressed, it gradually changes from peat into different types of coal, with the later types containing more carbon.

In the first stage, plants grow in warm wetlands. When they die, they fall into the water, where they do not decay completely. Over time, layers of this plant debris build up and are compressed to form peat, which is then buried under sand and mud over millions of years.

As a result of heat and pressure, the water is removed and the peat turns into lignite. Further compression produces bituminous coal, which has a higher carbon content, and eventually anthracite are formed. This is the hardest type of coal and it is made up of about 90% carbon. In the final stage, the coal is mined from underground seams, which is the only part of the process carried out by people.

Band 8

184 words

Well-placed overview capturing timescale and progression · stages selected and linked skilfully · precise vocabulary (accumulate, drive out, variety) · wide range of structures · error-free.

The diagram outlines the natural process by which coal is formed and the point at which it is finally extracted by humans for use.

It is clear that coal formation is an extremely slow, eight-stage process spanning millions of years, during which buried plant matter is progressively compressed into increasingly carbon-rich forms of coal, culminating in anthracite. Only the last stage involves human activity.

The sequence starts in warm, swampy wetlands, where plants flourish. When these plants die, they fall into the water and, crucially, fail to decompose fully, so that successive layers of debris accumulate and are compressed into peat. Over millions of years, this peat is buried beneath deposits of sand and mud.

Heat and pressure then drive out the water, converting the compressed peat into lignite, the first of the three types of coal shown. With further compression, lignite becomes bituminous coal, which has a higher carbon content, and ultimately anthracite, the hardest variety, containing approximately 90% carbon. At the final stage, this coal is extracted by mining underground seams, marking the shift from a natural process to a human one.

Solar water heating system

id wb1_process_18

The diagram below shows how a solar water heating system provides hot water for a house.

Band 6 187 words

Overview given late but relevant · all six stages covered and the cycle noted · simple linking · repetitive vocabulary · agreement, article and word choice errors that do not obscure meaning.

The diagram shows how a solar water heating system give hot water to a house. There are six stages and it is a cycle.

First, there is a solar panel on the roof of the house. The sunlight heats the fluid which is in the dark pipes of the panel. Then the hot fluid rises and it is carried to the storage cylinder.

In the storage cylinder there is a heat exchanger. It is a coil and it transfer the heat from the fluid to the water of the house. After that, the hot water is kept in a insulated cylinder, so the people in the house can use it later.

On cloudy days, there is not so much sun, so a backup boiler heats the water. Finally, the fluid which is cooled is returned to the solar panel by a pump, and then the cycle start again.

Overall, the system uses the sun to heat the water, but when the weather is cloudy it needs the boiler too. The fluid goes round and round between the panel and the cylinder, so it is used many times.

Band 7

180 words

Clear overview explaining the loop and backup · logical progression with passives and relative clauses · appropriate vocabulary (heat exchanger, insulated) · frequent error-free sentences with one agreement slip.

The diagram illustrates how a solar water heating system supplies a house with hot water.

Overall, the system works in a cycle of six stages, in which a fluid is heated by the sun, gives its heat to the household water and then returns to the solar panel to be heated again. A backup boiler is also included for cloudy days.

The process begins at the solar panel on the roof, where sunlight heats a fluid inside dark pipes. As it becomes hot, this fluid rises and is carried to the storage cylinder. Inside the cylinder, a coil known as a heat exchanger transfer the heat from the fluid to the household water, which is then kept in an insulated cylinder until it is needed.

On cloudy days, a backup boiler is used to heat the water, which means the house still has hot water when there is less sunshine. Meanwhile, the fluid which has cooled down is returned to the panel by a pump, and the cycle is repeated as the fluid is heated by the sun once more.

Band 8

183 words

Skilful overview describing the loop and supplementary boiler · stages sequenced fluently · precise vocabulary (circulates, supplements, overcast) · wide range of participle and passive structures · error-free.

The diagram explains how a solar water heating system provides a house with hot water, using sunlight as its primary source of energy.

The system operates as a continuous six-stage loop in which a fluid circulates between a roof-mounted solar panel and a storage cylinder, collecting heat at one end and releasing it at the other, before being pumped back to begin again. A backup boiler supplements the system when the weather is cloudy.

The cycle begins on the roof, where sunlight heats a fluid flowing through the dark pipes of the solar panel. Once heated, the fluid rises and is carried to the storage cylinder, where a coil acting as a heat exchanger transfers its heat to the household water. This water is then retained in an insulated cylinder so that it stays hot until required.

On overcast days, a backup boiler is used to heat the water. Having given up its heat, the cooled fluid is pumped back up to the panel on the roof, where it is warmed once again by the sun, allowing the process to repeat without interruption.

Processing wool into yarn

id wb1_process_19

The diagram below shows how raw sheep's wool is processed into yarn.

Band 6

176 words

Basic overview placed at the end · all eight stages covered in order · mechanical linking · adequate vocabulary · agreement and article errors plus a comma splice, meaning always clear.

The diagram shows how the raw wool from sheep is processed into yarn. There are eight stages in the process.

Firstly, the fleece is removed from the sheep in spring, this is called shearing. Then the dirty edges of the wool are removed and the wool is graded by its quality. After that, the wool is washed in warm soapy water for removing the grease. This stage is called scouring.

Next, the wool is dried by warm air. Then the fibres are combed so they are straight, and they make a soft web. This is carding. After that, the fibres are twisted and they become yarn, which is called spinning.

In the seventh stage, the yarn is dyed in large vats, so it have colour. Finally, the yarn is wound into balls or into cones.

Overall, the process start with the sheep and it ends with yarn which is ready to use. Most of stages are about cleaning the wool and making it into yarn, and the colour is added near the end of the process.

Band 7

185 words

Clear overview dividing the process into two halves · logical sequencing with passive forms · appropriate vocabulary (sheared, scoured, vats) · mostly error-free with one article slip.

The diagram illustrates the stages through which raw sheep's wool passes before it becomes yarn.

Overall, the process is linear and consists of eight stages. The first half involves removing the wool from the sheep and cleaning it, while the second half focuses on turning the fibres into yarn, colouring it and winding it.

The process begins in spring, when the fleece is sheared from the sheep. During skirting and grading, the dirty edges are cut away and the wool is graded according to the quality. It is then scoured, meaning that it is washed in warm soapy water to remove grease, and afterwards it is dried using warm air.

In the carding stage, the fibres are combed straight to create a soft web, and these fibres are then twisted into yarn during spinning. Following this, the yarn is coloured in large vats in the dyeing stage, before finally being wound into balls or cones. This means that the colour is added only after the yarn has been made. At this point, the yarn is ready to be used, for example for knitting or weaving.

Band 8

186 words

Insightful overview splitting the process into two phases · every stage covered with precise terminology (skirting, scoured, carded) · cohesion managed smoothly · wide range of structures · error-free.

The diagram depicts the process by which fleece shorn from sheep is transformed into finished yarn.

In total, there are eight stages, which can be broadly divided into two phases: the first four prepare and clean the raw wool, whereas the final four convert the clean fibres into yarn that is coloured and wound for use.

The process starts in spring, when sheep are sheared and their fleece is removed. This is followed by skirting and grading, in which the soiled edges are trimmed off and the wool is sorted according to its quality. The wool is then scoured in warm, soapy water to strip away grease, and subsequently dried with warm air. These preparatory steps ensure that the wool is clean before any processing of the fibres begins.

Once dry, the wool is carded, a step in which the fibres are combed straight into a soft web. These fibres are then spun, meaning they are twisted together to form yarn. The yarn is dyed in large vats and, in the final stage, wound into balls or cones, at which point it is ready for use.

Recycling old smartphones

id wb1_process_20

The diagram below shows how old smartphones are recycled.

Band 6

170 words

Overview late and simple · both routes and all stages covered in order · mechanical linking · some informal vocabulary · agreement and article errors and a comma splice, meaning always clear.

The diagram shows how the old smartphones are recycled. There are eight stages in this process.

First, people return their phones to the shops or send them by post. Then all the personal data on the phones is erased. After that, the phones are tested. If the phone is working, it is repaired and sold again to other people.

The faulty phones go to the next stage, it is dismantling. In this stage, the battery and the screen is removed. Then the battery is recycled and lithium and cobalt are recovered from it. The remaining parts of the phone are shredded into small pieces.

After the shredding, the metals like gold, silver and copper are extracted. Finally, all the materials are sold to manufacturers so they can use it again.

Overall, the process begins with the drop-off of old phones and ends with the reuse of materials. Some phones is repaired and sold again, but the others are broken into parts to get the metals and other materials from them.

Band 7

184 words

Clear overview identifying the two routes · logical progression with contrast and sequence linkers · appropriate vocabulary (dismantled, recovered, faulty) · mostly error-free with one agreement slip.

The diagram illustrates the process by which old smartphones are recycled, either by being reused as phones or by being broken down for their materials.

Overall, the process has eight stages, beginning with phones being dropped off and ending with materials being sold to manufacturers. A key feature is that phones which still work are repaired and resold, whereas faulty ones are taken apart so that their materials can be recovered.

At the start, phones are returned either to shops or by post, and all personal data is erased from them. They are then tested, and those that are working are repaired and sold again, so they do not continue to the later stages. Faulty phones, however, are dismantled, with the battery and the screen being removed.

After that, the batteries are recycled so that lithium and cobalt can be recovered, while the remaining parts of the phones are shredded. From this shredded material, three metals, namely gold, silver and copper, is extracted. In the final stage, all of these recovered materials are sold to manufacturers, who can reuse them to make new products.

Band 8

187 words

Skilful overview focusing on the decisive testing stage · both routes traced accurately · precise vocabulary (pivotal, constituent, defective) · wide range of complex and passive structures · error-free.

The diagram outlines how old smartphones are processed for recycling, from the moment they are handed in to the point at which their materials re-enter manufacturing.

Of the eight stages, testing is pivotal, since it determines which of two routes a phone will take: working devices are repaired and resold, while faulty ones are dismantled and broken down so that their constituent materials can be recovered and sold on.

Phones are first returned, either to shops or by post, after which all personal data stored on them is wiped. They are then tested, and those found to be in working order are repaired and put back on the market. Defective handsets, by contrast, are dismantled, with the battery and screen being removed. Notably, both routes begin only after the data-wiping stage, so no phone is tested while it still holds personal information.

The batteries are recycled to recover lithium and cobalt, whereas the remaining components are shredded. Gold, silver and copper are then extracted from this shredded material. Finally, all of the recovered materials are sold to manufacturers for reuse, which brings the process to an end.

International tourist arrivals, 2014-2024

id wb1_mixed_01

The bar chart below shows the number of international tourists visiting one country between 2014 and 2024, and the pie chart shows the main purposes of their visits in 2024.

Band 6 176 words

Overview present but basic and placed at the end · key figures accurate but reported mechanically · repetitive linking (Firstly, Then, Also) · adequate vocabulary · several article, preposition and agreement errors.

The bar chart give information about how many international tourists came to one country from 2014 to 2024, and the pie chart shows the reasons why they visited in 2024.

Firstly, looking at the bar chart, the number of tourists was 8.2 million in 2014 and it increased to 9.5 million in 2016. Then it rose again to 11.1 million in 2018. However, in 2020 there was a big drop and the number fell to only 3.4 million, which is the lowest in the period. After that, the tourists increased again to 7.8 million in 2022 and reached to 12.6 million in 2024, that was the highest number.

Also, the pie chart shows that holiday was the main purpose of visit with 54%, which is more than a half. Visiting family and friends was 19% and business was 15%. The study had 8% and the smallest purpose was medical with only 4%.

Overall, the number of tourists went up in the period apart from a sharp fall in 2020, and most of visitors came for holiday.

Band 7 189 words

Clear overview of trend and main purpose · key features well highlighted with a useful comparison · logical progression and good range of linkers · some less common vocabulary · two minor slips.

The bar chart illustrates changes in the number of overseas visitors to a particular country over a ten-year period from 2014, while the pie chart breaks down their reasons for travelling there in 2024.

Overall, tourist arrivals grew steadily apart from a dramatic collapse in 2020, after which they recovered strongly to reach a peak in the final year. As for the purpose of visits, holidays accounted for the majority, whereas medical trips were the least common.

In 2014, 8.2 million international tourists arrived in the country, and this figure climbed gradually to 9.5 million in 2016 and 11.1 million in 2018. In 2020, however, arrivals plummeted to just 3.4 million, less than one third of previous total. The number then rebounded to 7.8 million in 2022 before hitting 12.6 million in 2024, the highest point in the period.

Turning to the pie chart, more than half of visitors (54%) came for a holiday. Visiting family or friends was the second most common reason, at 19%, followed closely by business at 15%. Only a small proportion of tourists travelled for study or medical purpose, with 8% and 4% respectively.

Band 8

198 words

Well-placed overview linking both charts · figures selected skilfully with accurate derived comparisons · seamless cohesion · precise vocabulary (trajectory, slump, recovery) · wide range of structures, error-free.

The two charts provide information about international tourism in one country: the bar chart tracks annual arrivals between 2014 and 2024, and the pie chart shows why visitors came in the final year.

Arrivals followed a broadly upward trajectory over the decade, interrupted only by a sharp slump in 2020 from which the sector had more than recovered by 2024. Leisure was by far the dominant motive for travel, accounting for over half of all visits.

In 2014 the country received 8.2 million foreign visitors, a figure that rose steadily to 11.1 million by 2018. This growth was abruptly reversed in 2020, when arrivals collapsed to 3.4 million, roughly 30% of the 2018 level. A strong recovery followed, with numbers more than doubling to 7.8 million in 2022 and then climbing to a ten-year high of 12.6 million in 2024, some 1.5 million above the pre-2020 peak.

Regarding the purpose of visits, holidaymakers made up 54% of tourists in 2024, almost three times the proportion who came to see family or friends (19%). Business travel accounted for a similar share, at 15%, while study and medical treatment were comparatively minor reasons, representing just 8% and 4% respectively.

☐ Approved ☐ Needs changes Notes:

Population of Marlow City, 1950-2020

id wb1_mixed_02

The line graph below shows the population of a city between 1950 and 2020, and the table shows the types of housing in the city in 1950 and 2020.

Housing stock by type (% of homes)

Type	1950	2020
Detached houses	18	11
Terraced houses	61	24
Apartments	12	58
Other	9	7

Band 6

174 words

Simple but relevant overview · all main features covered, though the population data is listed year by year · adequate linking · limited vocabulary (increased, grew) · errors in verb forms, agreement and punctuation.

The line graph shows how the population of Marlow City changed from 1950 to 2020 and the table show the different kinds of housing in the city in 1950 and 2020.

Overall, the population increased a lot during the period and the most common type of housing changed from terraced houses to apartments.

In 1950 the population of the city was 0.4 million. It rised to 0.6 million in 1960 and 0.9 million in 1970. Then it continued to grow to 1.2 million in 1980 and 1.3 million in 1990, which was a slow increase. After that the population grew more quickly, it reached 1.9 million in 2010 and 2.4 million in 2020. This means the population was six times bigger at the end.

Looking at the table, in 1950 terraced houses was the biggest type with 61%, but in 2020 it fell to 24%. On the other hand, apartments increased from 12% to 58%. Detached houses decreased from 18% to 11% and other type of housing went down slightly from 9% to 7%.

Band 7

182 words

Clear overview of both visuals · key stages of growth identified rather than listed · good cohesion (From that point on, As for) · some less common vocabulary · occasional minor errors.

The line graph illustrates the growth in Marlow City's population over seventy-year period starting in 1950, while the table compares the proportions of different housing types in the first and last years.

It is clear that the city's population rose continuously, increasing sixfold overall. At the same time, the housing stock shifted markedly from terraced houses towards apartments, which became the dominant type by 2020.

In 1950, Marlow City had 0.4 million residents. This number climbed steadily to 1.2 million by 1980, but growth then slowed considerably, with the population reaching only 1.3 million in 1990. From that point on, the increase accelerated again, to 1.5 million in 2000 and 1.9 million in 2010, before peaking at 2.4 million in 2020.

As for housing, terraced houses made up 61% of homes in 1950, yet their share had fallen to 24% by 2020. Apartments showed the opposite pattern, rising from just 12% to 58%, which is almost five times as much. Detached houses became less common, dropping from 18% to 11%, whereas the other category remain relatively stable at 9% and 7% respectively.

Band 8

199 words

Well-selected key features and a clear overview · the two visuals linked naturally · accurate figures and derived comparisons · precise vocabulary (marginal, prevalent, composition) · wide range of error-free structures.

The line graph charts the population of Marlow City from 1950 to 2020, and the accompanying table shows how the composition of its housing stock changed between the start and end of that period.

The most striking features are the city's sustained population growth, with the number of residents multiplying six times over, and a fundamental shift in housing from terraced houses to apartments.

Marlow City's population stood at 0.4 million in 1950 and grew at a fairly steady pace to 1.2 million by 1980, tripling in thirty years. The following decade saw only marginal growth, to 1.3 million, but expansion resumed thereafter and gathered pace after 2000, so that the city was home to 2.4 million people by 2020.

This growth coincided with a transformation in the type of homes available. In 1950, terraced houses accounted for 61% of the housing stock, around five times the proportion of apartments (12%). By 2020, however, the positions had been reversed: apartments comprised 58% of homes, while the share of terraced houses had shrunk to 24%. Detached houses also became less prevalent, falling from 18% to 11%, and other types of accommodation changed little, edging down from 9% to 7%.

Average monthly temperature

id wb1_mixed_03

The graph below shows average monthly temperatures in one city, and the bar chart shows the average monthly rainfall there.

Band 6

186 words

Overview is present but comes last and is basic · both charts covered with accurate figures · mechanical linking (Firstly, Then, Also) · some awkward word choice · several agreement and preposition errors.

The line graph shows the average maximum and minimum temperature in a city in each month, and the bar chart shows how much rain the city get every month.

Firstly, the maximum temperature is quite stable. It is 31°C in January and goes up to 33°C in March and April, which is the highest. Then it falls to 29°C in July and August and after it increases again to 31°C in the end of year. The minimum temperature changes more. It start at 18°C in January, rises to 26°C in May and stays at 25°C from June to September.

Also, the rainfall is very different in each month. In January there is only 8mm and in December 10mm. From April the rain increases sharply and it reach the peak of 370mm in July. Then it decreases to 290mm in September and 180mm in October, and it is only 35mm in November.

Overall, the temperature is hot all year, but there is a very wet season in the middle of year and a dry season at the start and end.

Band 7

193 words

Clear overview contrasting temperature and rainfall · key features highlighted with ranges and peaks · logical paragraphing · good range of vocabulary (dipping, seasonal) · mostly accurate with one minor slip.

The line graph illustrates the average highest and lowest temperatures in a particular city throughout the year, while the bar chart shows its average rainfall for each month.

Overall, the city is warm all year round, with maximum temperatures varying only slightly, whereas rainfall is highly seasonal, being concentrated in the middle months of the year.

Average maximum temperatures remain between 29°C and 33°C for the whole year. They peak at 33°C in March and April before dipping to a low of 29°C in July and August, and then return to 31°C for the last three months. Minimum temperatures show greater variation, climbing from

18°C in January to a high of 26°C in May. They stay at 25°C until September before falling back to 18°C in December.

In terms of rainfall, the first three months and the last two are relatively dry, with less than 50mm each month, and January is the driest at just 8mm. Rainfall rises dramatically from April onwards, reaching the peak of 370mm in July. It then declines steadily to 180mm in October and drops sharply to 35mm in November.

Band 8

212 words

Insightful overview contrasting stable temperatures with seasonal rainfall · well-chosen derived comparisons (temperature gap) · cohesion managed skilfully · precise, natural vocabulary · wide range of error-free structures.

The line graph compares the average monthly maximum and minimum temperatures in one city, and the bar chart presents its average monthly rainfall.

The city experiences consistently high temperatures, with the maximum fluctuating within a narrow band of just four degrees. Rainfall, by contrast, varies enormously, with a pronounced wet season from May to September and very dry conditions around the turn of the year.

Maximum temperatures are highest in March and April, at 33°C, and lowest in July and August, at 29°C, remaining between 30°C and 32°C in every other month. Minimum temperatures fluctuate more widely, from a low of 18°C in December and January to 26°C in May, and they hold steady at 25°C from June to September. As a result, the gap between the maximum and minimum is widest in December and January, at 13 degrees, and narrowest in July and August, at just four.

Rainfall is low from November to March, ranging from 8mm in January to 45mm in March. It then increases sharply, surging from 110mm in April to 260mm in May and peaking at 370mm in July. Although it falls back gradually to 290mm in September, a steep decline follows, to 180mm in October and just 35mm in November.

179 words

Overview present but placed at the end and fairly general · all visuals covered accurately but mechanically · repetitive verbs (fell, increased) · errors with articles, tense and quantifiers that do not block meaning.

The table shows the car ownership in one country in 1995, 2010 and 2025, and the two pie charts show how people go to work in 1995 and 2025.

In the table, the number of cars increased from 14.2 million in 1995 to 19.8 million in 2010 and then 22.1 million in 2025. The cars per 1,000 people also went up from 280 to 360 and after to 385. However, the percentage of households with no car decreased from 33% to 25% and then 23%.

In the pie charts, car was the most popular way to travel to work in both years, but it fell from 64% to 57%. Bus also fell from 14% to 8% and walking decreased from 12% to 8%. On the other hand, train increased from 6% to 10% and bicycle went up from 4% to 7%. In 2025 there was a new category, work from home, which was 10%.

Overall, car ownership increased over the period, but less people used car to go to work in 2025 and some people worked at home.

Band 7

202 words

Clear overview linking ownership and commuting · key changes highlighted, including timing of the decline · good range of linkers (Despite this, By contrast) · appropriate vocabulary · one or two minor grammatical slips.

The table provides data on car ownership in a country in 1995, 2010 and 2025, and the two pie charts compare the ways people commuted to work in the first and last of these years.

Overall, car ownership rose steadily over the thirty years. Despite this, the proportion of people driving to work fell slightly, while train travel, cycling and working from home became more common.

The number of cars grew from 14.2 million in 1995 to 19.8 million in 2010 and 22.1 million in 2025. Similarly, there were 280 cars per 1,000 people in 1995, but this figure had risen to 385 by 2025. Meanwhile, the share of households without a car dropped from a third to 23%, although most of this decline happened before 2010.

Regarding commuting, the car remained by far the most popular method, even though its share decreased from 64% to 57%. Bus use fell considerably, from 14% to 8%, and walking also became less common, falling from 12% to 8%. By contrast, the proportion of commuters taking the train rose from 6% to 10%, and cycling grew from 4% to 7%. In addition, 10% of people was working from home in 2025, a new category.

Band 8

204 words

Concise overview capturing the central contrast · data grouped and compared skilfully across all three visuals · accurate figures · precise, varied vocabulary (density, levelling off, principal) · wide range of error-free structures.

The table sets out figures on car ownership in one country in 1995, 2010 and 2025, while the pie charts illustrate how people travelled to work in 1995 and 2025.

Although car ownership increased throughout the period, the car's dominance as a means of commuting weakened somewhat, with rail, cycling and home working all gaining ground.

The number of cars on the country's roads rose by almost 8 million over the thirty years, from 14.2 million to 22.1 million, with the sharpest growth occurring between 1995 and 2010. Car density followed the same pattern, increasing from 280 to 360 vehicles per 1,000 people in the first fifteen years but only to 385 by 2025. Correspondingly, the proportion of households without a car fell from 33% to 25% by 2010, before levelling off at 23%.

Turning to commuting, the car remained the principal mode of transport, although its share slipped from 64% to 57%. Bus travel and walking both declined, to 8% each, from 14% and 12% respectively. Train use, on the other hand, increased from 6% to 10%, and cycling from 4% to 7%. Perhaps most notably, working from home, which did not feature in 1995, accounted for 10% of workers by 2025.

Average world coffee price, 2014-2024

id wb1_mixed_05

The line graph shows the average world price of coffee between 2014 and 2024, and the bar chart shows coffee exports from four countries in 2014 and 2024.

Band 6

181 words

Basic overview given only at the end · all figures accurate but presented one by one · adequate but repetitive linking · simple vocabulary · noticeable errors in plurals, verb forms and relative clauses.

The line graph shows the average price of coffee in the world from 2014 to 2024, and the bar chart shows how much coffee four country exported in 2014 and 2024.

According to the line graph, the price of coffee was \$4.4 per kg in 2014. It decreased to \$3.5 in 2016 and continued to fall to \$2.9 in 2018 and \$2.6 in 2020, which was the lowest price. However, after 2020 the price increased very fast and it was \$5.2 in 2022. In 2024 it reached \$6.1 per kg, that is the highest in the period.

The bar chart shows that Brazil was the biggest exporter in both year. Its exports increased from 2.1 million tonnes to 2.6 million tonnes. Vietnam was in second place and its exports rised a little from 1.5 to 1.6 million tonnes. Colombia exports stayed the same at 0.7 million tonnes, and Ethiopia exported the least, but its exports doubled from 0.2 to 0.4 million tonnes.

In conclusion, the coffee price fell and then rose sharply, and most of countries exported more coffee in 2024.

Band 7

193 words

Clear overview of price trend and export leader · key features highlighted with apt comparisons (doubling, around 40%) · good cohesion · some less common vocabulary (rebounded, shipped) · two minor slips.

The line graph illustrates changes in the average global price of coffee between 2014 and 2024, and the bar chart compares the quantity of coffee exported by four countries at the beginning and end of this period.

Overall, the price of coffee fell for six years and then rose sharply to its highest level in 2024. Brazil was the leading exporter in both years, and three of the four countries increased its exports.

In 2014, coffee cost an average of US\$4.4 per kilogram. The price declined steadily over the next six years, reaching a low of US\$2.6 in 2020. After this, however, it rebounded dramatically, doubling to US\$5.2 in 2022 and climbing further to US\$6.1 by 2024, which was around 40% higher than the starting price.

As regards to exports, Brazil shipped 2.1 million tonnes of coffee in 2014, and this rose to 2.6 million tonnes in 2024. Vietnam was the second largest exporter, although its exports grew only slightly, from 1.5 to 1.6 million tonnes. Colombia's exports remained unchanged at 0.7 million tonnes, while Ethiopia, despite being the smallest exporter, doubled the amount it sold abroad from 0.2 to 0.4 million tonnes.

Band 8

187 words

Skilful overview summarising both visuals · accurate figures used selectively with precise derived comparisons · sophisticated cohesion · wide, precise vocabulary (bottoming out, consolidated) · varied, error-free sentence structures.

The line graph traces the average world price of coffee from 2014 to 2024, while the bar chart compares the coffee exports of four producing countries in the first and final years of that period.

Coffee prices followed a pronounced V-shaped pattern, bottoming out in 2020 before surging to a decade high. Over the same timeframe, Brazil consolidated its position as the largest exporter, and export volumes either rose or held steady in all four nations.

Starting at US\$4.4 per kilogram in 2014, the world price fell continuously to US\$2.6 in 2020, a drop of around 40%. The subsequent recovery was far steeper: within two years the price had doubled to US\$5.2, and by 2024 it had reached US\$6.1, well above its initial level.

Brazil's exports rose from 2.1 to 2.6 million tonnes, widening its lead over Vietnam, the second largest exporter, whose volumes barely changed (1.5 and 1.6 million tonnes). Colombia's exports remained static at 0.7 million tonnes. Ethiopia, by contrast, was by far the smallest exporter, yet it recorded the most rapid proportional growth, with its exports doubling from 0.2 to 0.4 million tonnes.

Total student numbers, 2019-2025

id wb1_mixed_06

The bar chart below shows the number of students at a university from 2019 to 2025, and the pie charts show the students' places of origin in 2019 and 2025.

Band 6 170 words

Overview present but basic · all data covered accurately, though listed year by year · simple linking (Then, So, However) · repetitive vocabulary (increased, decreased) · several errors in tense, articles and word choice.

The bar chart shows the number of undergraduate and postgraduate students in a university between 2019 and 2025. The pie charts show where the students come from in 2019 and 2025.

Overall, the number of students increased in both group, and the percentage of international students become bigger.

In 2019 there were 14.5 thousand undergraduate students. This number increased to 15.2 thousand in 2021 and 15.8 thousand in 2023, and in 2025 it was 16.1 thousand. The postgraduate students were much less, but they grew faster. They were 3.2 thousand in 2019, then 3.9 thousand in 2021, 5.1 thousand in 2023 and 6.4 thousand in 2025. So the number of postgraduate students doubled.

Looking at the pie charts, in 2019 more than half of the students came from home region (55%), 30% came from other regions and 15% were international. In 2025 the home region students decreased to 44% and other regions decreased a little to 28%. However, international students increased to 28%, which is the same like other regions.

Band 7

193 words

Clear overview covering all three visuals · key contrasts highlighted (growth rates, rising international share) · good cohesion · appropriate less common vocabulary (enrolment) · a couple of minor grammatical slips.

The bar chart compares the numbers of undergraduate and postgraduate students at a university from 2019 to 2025, while the two pie charts show where the students came from in 2019 and 2025.

Overall, student numbers rose in both categories, with postgraduate enrolment growing much more rapidly. In addition, the university became considerably more international, although students from home region still formed the largest group.

Undergraduates made up the vast majority of students throughout the period. Their numbers increased gradually from 14.5 thousand in 2019 to 16.1 thousand in 2025. Postgraduate numbers were far lower but rose at a much faster rate, from 3.2 thousand to 3.9 thousand in 2021 and then to 5.1 thousand in 2023, before reaching 6.4 thousand in 2025, which is exactly twice the original figure.

Regarding origin, 55% of students came from the home region in 2019, but this proportion fell to 44% in 2025. The share from other regions was fairly stable, dropping only from 30% to 28%. The most significant change was in international students, whose share almost doubled from 15% to 28%, so that by 2025 they were as numerous as students from other regions.

Band 8

201 words

Perceptive overview linking growth and origin · figures selected and combined skilfully (totals, doubling) · cohesion seamless · precise vocabulary (make-up, contracted, drawing level) · wide range of error-free structures.

The bar chart presents undergraduate and postgraduate enrolment at a university between 2019 and 2025, and the pie charts break down the student body by place of origin in the first and last of those years.

The university expanded over the six years, largely because of a surge in postgraduate numbers, and its intake became markedly more international, even though students from the home region remained the single largest group.

Undergraduates vastly outnumbered postgraduates throughout, but their numbers grew only modestly, from 14.5 thousand to 16.1 thousand. Postgraduate enrolment, by contrast, rose at an accelerating pace, from 3.2 thousand in 2019 to 5.1 thousand in 2023 and 6.4 thousand in 2025, precisely double its starting level. As a result, the total number of students increased from 17.7 thousand to 22.5 thousand.

The make-up of the student body also changed considerably. In 2019, over half of all students (55%) came from the university's home region, while 30% were from other regions and only 15% from overseas. By 2025, the home-region share had contracted to 44%, and that of other regions had edged down to 28%. International students, meanwhile, had almost doubled their share to 28%, drawing level with those from other regions.

Electricity generation by source, 2024

id wb1_mixed_07

The pie chart below shows how a country's electricity was generated in 2024, and the line graph shows electricity prices for households and businesses between 2016 and 2024.

Electricity generation by source, 2024

Average electricity price, 2016-2024

Band 6

181 words

Overview present but placed at the end · both visuals covered with accurate figures · mechanical organisation and linking · limited range of vocabulary · comma splices and agreement errors that do not impede meaning.

The pie chart shows the sources of electricity in a country in 2024 and the line graph shows the price of electricity for households and businesses from 2016 to 2024.

In the pie chart, natural gas was the biggest source with 38%. Wind was the second with 27% and nuclear was 14%. The other sources were smaller, biomass had 9%, solar had 7%, other had 3% and coal was only 2%.

In the line graph, households always paid more than businesses. In 2016 the price for households was 15 cents per kWh and for businesses 11 cents. From 2016 to 2020 the prices increased slowly and households reached 17 cents and businesses 12 cents. Then in 2022 the prices increased very sharply, households' price doubled to 34 cents and business price was 29 cents. After that, both prices went down in 2024, to 27 cents for households and 21 cents for businesses.

Overall, gas and wind produced most of the electricity, and the price of electricity rose a lot in 2022 and then fell but it was still higher than 2016.

Band 7

198 words

Clear overview of generation mix and price trend · key features highlighted with apt comparisons · logical paragraphing and good linking · some less common vocabulary (marginally) · one minor agreement slip.

The pie chart illustrates the proportion of a country's electricity produced from different sources in 2024, and the line graph shows how average electricity prices for homes and businesses changed between 2016 and 2024.

Overall, natural gas and wind together generated almost two thirds of the country's electricity. As for prices, both groups saw a dramatic rise in 2022, followed by a partial fall, with households paying more than businesses throughout.

Natural gas was the largest source of electricity, at 38%, followed by wind at 27%. Nuclear power contributed 14%, while biomass and solar provides 9% and 7% respectively. Coal played only a very minor role, accounting for just 2%, and other sources made up the remaining 3%.

Turning to prices, households paid 15 cents per kWh in 2016, compared with 11 cents for businesses. These figures rose only marginally over the next four years, to 17 and 12 cents. However, between 2020 and 2022 prices doubled for households, reaching 34 cents, and more than doubled for businesses, which were charged 29 cents. By 2024 prices had dropped back to 27 cents for households and 21 cents for businesses, but this was still well above the 2016 levels.

Band 8

200 words

Skilful overview of both visuals · data grouped logically with precise derived comparisons · cohesion well managed · natural, precise vocabulary (negligible, crept up, eased) · wide range of structures with no errors.

The pie chart breaks down electricity generation in one country by source in 2024, while the line graph tracks the average price of electricity paid by households and businesses from 2016 to 2024.

Natural gas and wind power dominated the generation mix, whereas coal had become almost negligible. Prices for both types of consumer were broadly stable until 2020 before spiking sharply, and although they eased by 2024, they remained far higher than at the start of the period.

Natural gas supplied the largest share of electricity, at 38%, with wind not far behind at 27%. Nuclear power contributed a further 14%, while biomass and solar accounted for 9% and 7% respectively. Coal generated a mere 2%, even less than the 3% from other sources.

Households consistently paid more per unit than businesses. Between 2016 and 2020, household prices crept up from 15 to 17 cents per kWh and business prices from 11 to 12 cents. Over the following two years, however, the household price doubled to 34 cents, and the business price more than doubled to 29 cents. By 2024 they had fallen back to 27 and 21 cents respectively, still 12 and 10 cents higher than in 2016.

☐ Approved ☐ Needs changes Notes:

Weekly household energy spending by income group

id wb1_mixed_08

The bar chart below shows average weekly spending on energy by households in five income groups, and the table shows the average energy used by each group.

Band 6

187 words

Relevant overview identifying the main contrast · all figures accurate but listed mechanically · repetitive structures (The ... group spend) · limited vocabulary · errors in articles, agreement and phrasing.

The bar chart shows how much money households in five income groups spend on energy every week, and the table shows how much energy each group use and what percentage of their income they spend on it.

Overall, richer households spend more money and use more energy, but the poorer households spend bigger part of their income on energy.

According to the bar chart, the lowest 20% spend \$28 per week on energy. The second group spend \$33 and the middle group spend \$37. The fourth group spend \$42 and the highest 20% spend the most, \$55 per week, which is almost double of the lowest group.

In the table, the energy used also increase with income. The lowest group use 9,800 kWh per year, and the number goes up to 11,400, 12,900 and 14,700 kWh. The highest group use 19,200 kWh. However, the percentage of income is opposite. The lowest group spend 11.2% of their income on energy, but the second group spend 7.5% and the middle group 5.4%. The fourth group spend 4.1% and the highest group spend only 2.9%.

Band 7

202 words

Clear overview of the central contrast · key features highlighted with useful differences · good range of cohesive devices · some less common vocabulary (devote, consumption) · mostly error-free with one slip.

The bar chart illustrates the average amount that households in five income groups spend on energy each week, while the table provides information on their annual energy consumption and the proportion of their income that goes on energy.

Overall, both spending on energy and energy use rise steadily with income. However, the poorest households devote a far larger share of their income to energy than the wealthiest ones.

Weekly spending ranges from \$28 for the lowest 20% of earners to \$55 for the highest 20%, so the richest group spends almost twice as much. The increases between the lower groups are fairly even, at around \$4–5 each, whereas the gap between the fourth and highest groups is much wider, at \$13.

A similar pattern can be seen in energy use. The lowest-income households consume 9,800 kWh a year, which rises to 14,700 kWh for the fourth group and 19,200 kWh for the top group. In contrast, the percentage of income spent on energy falls sharply as incomes rise. It stands at 11.2% for the poorest fifth, compared with 7.5% for the second group and 5.4% for the middle group, and drops to only 2.9% among the richest households.

Band 8

189 words

Well-judged overview capturing the inverse relationship · figures selected purposefully with accurate multiples · skilful cohesion across both visuals · precise vocabulary (burden, gradient, absorb) · varied, error-free structures.

The bar chart compares average weekly energy expenditure across five household income groups, and the table details each group's annual energy consumption together with the share of income that this spending represents.

Wealthier households both spend more on energy and use more of it, yet energy costs place a far heavier burden on lower-income households, for whom they absorb a much larger proportion of earnings.

Weekly spending climbs steadily through the income bands, from \$28 for the lowest fifth to \$42 for the fourth, before jumping to \$55 for the top fifth, almost double the figure for the poorest group. Energy consumption follows the same upward gradient: the lowest-income households use 9,800 kWh annually, while the highest-income households use 19,200 kWh, again nearly twice as much.

The relationship reverses, however, when spending is viewed as a percentage of income. The poorest fifth of households devote 11.2% of their income to energy, around four times the proportion spent by the richest fifth (2.9%). Between these extremes, the figure declines progressively, from 7.5% for the second group to 5.4% for the middle group and 4.1% for the fourth.

☐ Approved ☐ Needs changes Notes:

Cinema tickets sold, 2000-2024

id wb1_mixed_09

The line graph shows the number of cinema tickets sold in one country from 2000 to 2024, and the pie chart shows how adults usually watched films in 2024.

Band 6

185 words

Basic overview near the start · key features covered with accurate figures · adequate but simple linking · some repetition and imprecise wording · errors in verb form, agreement and articles, plus a weak ending.

The line graph shows how many cinema tickets were sold in one country from 2000 to 2024. The pie chart shows the main ways adults watched films in 2024.

Overall, the tickets sales were quite stable for many years but they fell a lot in 2020. In 2024 most adults watched films by streaming.

In 2000, 142 million tickets were sold. This number rise to 171 million in 2004 and then it stayed around 170 million until 2016, with 164 million in 2008, 172 million in 2012 and 168 million in 2016. However, in 2020 the sales dropped dramatically to only 44 million, which was the lowest point. After that, it recovered to 121 million in 2024 but it was still lower than in 2000.

The pie chart shows that streaming services was the most popular way to watch films, with 58% of adults. The second was broadcast TV with 18%, and cinema was only 12%. Download or rental had 9% and DVD or Blu-ray was the least popular with 3%.

To sum up, the cinema is not very popular way for watching films nowadays.

Band 7

204 words

Clear overview linking both visuals · key features highlighted with useful comparisons (a quarter, more than all others combined) · good cohesion · some less common vocabulary · one minor slip.

The line graph shows the number of cinema tickets sold in a particular country between 2000 and 2024, and the pie chart illustrates the main ways in which adults watched films in 2024.

Overall, ticket sales were relatively stable for most of the period before collapsing in 2020 and only partly recovering. Meanwhile, streaming was by far the most common way for adults to

watch films in 2024, with cinema attracting only a small minority.

In 2000, 142 million cinema tickets were sold, and this figure rose to 171 million in 2004. For the next twelve years, sales fluctuated only slightly, ranging between 164 million and 172 million. In 2020, however, they plunged to just 44 million, around a quarter of the 2016 level. By 2024 they had recovered to 121 million, although this remained below the figure for 2000.

Looking at the pie chart, 58% of adults mainly used streaming services to watch films, which is more than all other methods combined. Broadcast TV was the second most popular option, at 18%, while the cinema was the main choice for only 12% of adults. Downloads and rentals accounted for 9%, and just 3% of people still mainly watched film on DVD or Blu-ray.

Band 8

203 words

Well-placed overview synthesising both visuals · key stages selected skilfully with accurate derived figures · cohesion managed smoothly · precise vocabulary (plateaued, marginal, medium) · wide range of structures, error-free.

The line graph traces annual cinema ticket sales in one country from 2000 to 2024, while the pie chart identifies the main way in which adults watched films in the final year.

Ticket sales held up well for most of the period but slumped dramatically in 2020 and had not fully recovered by 2024. By that year, streaming had become the dominant means of watching films, with the cinema a relatively marginal choice.

After rising from 142 million in 2000 to 171 million in 2004, sales plateaued, remaining within a narrow range of 164 to 172 million until 2016. This stability ended abruptly in 2020, when sales plummeted to 44 million, roughly a quarter of the 2016 figure. A partial recovery followed, lifting sales to 121 million in 2024, still some 21 million short of the 2000 total.

The pie chart shows that streaming services were the main source of films for 58% of adults, more than three times the share for broadcast TV (18%), the next most popular medium. Only 12% of adults chose the cinema as their principal way of viewing films, while downloads or rentals accounted for 9% and physical discs such as DVDs and Blu-rays for a mere 3%.

☐ Approved ☐ Needs changes Notes:

Household waste produced

id wb1_mixed_10

The table shows the amount of household waste produced in a city between 2000 and 2024, and the bar chart shows how that waste was disposed of.

Household waste produced

Year	Total waste (thousand tonnes)	Waste per person (kg)
2000	420	520
2008	455	535
2016	430	480
2024	395	425

Band 6

187 words

Overview present but general and placed last · both visuals covered accurately · mechanical linking (Firstly, After that, On the other hand) · repetitive vocabulary · errors in verb forms, tense and a comma splice.

The table shows how much household waste was produced in a city from 2000 to 2024, and the bar chart shows the ways that the waste was disposed.

Firstly, the total waste increased from 420 thousand tonnes in 2000 to 455 thousand tonnes in 2008. After that it decreased to 430 thousand tonnes in 2016 and 395 thousand tonnes in 2024. The waste per person had a similar pattern. It was 520 kg in 2000 and went up to 535 kg in 2008, then it fell to 480 kg and finally 425 kg in 2024.

In the bar chart, landfill was the main method in 2000 with 79%, but it decreased a lot and in 2024 it was only 12%. On the other hand, recycling and composting increase from 14% to 30% in 2008, 45% in 2016 and 52% in 2024. Incineration also went up from 7% in 2000 to 36% in 2024, although it only rise slightly between 2000 and 2008.

Overall, the city produced less waste at the end of the period, and less waste goes to landfill while more waste was recycled or burned.

Band 7

203 words

Clear overview of both the waste trend and the change in disposal · key features logically organised · good range of linkers · some less common vocabulary (landfilled, overtook) · one minor verb error.

The table gives information about the quantity of household waste produced in a city between 2000 and 2024, while the bar chart shows the proportions of this waste that were landfilled, recycled or composted, and incinerated.

Overall, the amount of waste rose slightly at first but then fell, ending below its 2000 level. At the same time, there was a dramatic shift away from landfill towards recycling and incineration.

Total household waste stood at 420 thousand tonnes in 2000 and peaked at 455 thousand tonnes in 2008. It then declined to 430 thousand tonnes in 2016 and to 395 thousand tonnes in 2024. The amount of waste per person followed a similar trend, increasing from 520 kg to 535 kg before dropping steadily to 425 kg by 2024.

As for disposal, landfill accounted for 79% of waste in 2000, but its share decreased continuously to just 12% in 2024. In contrast, recycling and composting grew rapidly from 14% to 52%, becoming the main method from 2016 onwards. Incineration for energy was the least used method at first, at only 7% in 2000, but it rose to 21% in 2016 and 36% by 2024, which meant it overtook landfill at some point after 2016.

Band 8

198 words

Incisive overview capturing the reversal in disposal methods · accurate figures and derived comparisons chosen selectively · cohesion managed skilfully · precise vocabulary (per capita, mirrored, shrank) · wide range of error-free structures.

The table presents the total and per capita amounts of household waste generated in a city in four years between 2000 and 2024, and the bar chart shows how this waste was dealt with.

The volume of waste peaked in 2008 and declined thereafter, while methods of disposal were transformed: landfill, initially the overwhelmingly dominant method, became the least used, overtaken by both recycling and incineration.

The city produced 420 thousand tonnes of household waste in 2000, rising to 455 thousand tonnes in 2008. Output then fell in each subsequent year shown, reaching 395 thousand tonnes in 2024. Waste per person mirrored this trend but fell more steeply, from a high of 535 kg in 2008 to 425 kg in 2024, roughly a fifth lower.

In 2000, almost four fifths of household waste (79%) was sent to landfill, with recycling and composting handling 14% and incineration just 7%. Over the following 24 years, landfill's share shrank to a mere 12%, whereas recycling and composting nearly quadrupled to 52%, making it the leading method by 2016. Incineration for energy, which had grown only marginally by 2008, expanded rapidly thereafter, accounting for over a third of waste (36%) by 2024.

Average age at first marriage, 1970-2020

id wb1_mixed_11

The line graph below shows the average age at which men and women in one country first married between 1970 and 2020, and the bar chart shows the number of marriages in the same period.

Band 6 178 words

Clear but simple overview · both visuals covered accurately, though figures are listed rather than compared · basic linking (Then, After that) · adequate vocabulary · errors in agreement, articles and a comma splice.

The line graph shows the average age that men and women got married for the first time in one country from 1970 to 2020, and the bar chart shows how many marriages there was in the same period.

Overall, people married at older age over the period, but the number of marriages went down.

According to the line graph, in 1970 men married at 24.4 years and women at 22.4 years. The ages increased slowly until 1980, men was 25.3 and women 23.1. After that the ages rose faster. In 2000 men married at 29.9 and women at 27.8, and in 2020 the ages reached 33.8 for men and 31.9 for women. Men was always about two years older than women.

The bar chart shows that there were 415 thousand marriages in 1970. Then the number decreased every ten years. It was 370 thousand in 1980, 331 thousand in 1990 and 268 thousand in 2000. In 2010 it fell to 243 thousand and in 2020 there were only 196 thousand marriages, which is less than half of 1970.

Band 7 195 words

Clear overview of both trends and the constant gender gap · key features highlighted, including the sharpest fall · good cohesion · some less common expressions · one minor grammatical slip.

The line graph illustrates changes in the average age at which men and women in a particular country first got married between 1970 and 2020, while the bar chart shows the total number of marriages over the same fifty years.

Overall, people married for the first time at an increasingly later age, with men consistently marrying about two years later than women. Meanwhile, the number of marriages decreased

steadily throughout the period.

In 1970, the average age at first marriage was 24.4 for men and 22.4 for women. These figures rose only slightly over the following decade, but from 1980 onwards the increase became more rapid, with men reaching 29.9 and women 27.8 in 2000. By 2020, the average man was 33.8 when he first married, compared with 31.9 for women, meaning that both ages had risen by more than nine years.

Turning to the number of marriages, there were 415 thousand in 1970, and this figure fell in every decades shown. The sharpest drop took place in the 1990s, when numbers declined from 331 thousand to 268 thousand. By 2020 only 196 thousand couples married, which was less than half of the 1970 total.

Band 8

190 words

Concise, well-placed overview · key features and the stable gender gap selected skilfully · accurate derived figures · precise, natural vocabulary (progressively, respective) · wide range of structures with no errors.

The line graph charts the average age at which men and women in one country entered their first marriage between 1970 and 2020, and the bar chart records the number of marriages across the same period.

Two clear trends emerge: first marriages took place progressively later in life for both sexes, and the number of marriages fell continuously, more than halving over the fifty years.

In 1970, men first married at an average age of 24.4 and women at 22.4. The rise was modest in the 1970s, but it accelerated markedly from 1980, and by 2020 the respective averages had reached 33.8 and 31.9, an increase of more than nine years for each sex. Notably, the gap between men and women remained remarkably consistent, at roughly two years, throughout the period.

Meanwhile, the number of marriages dropped from 415 thousand in 1970 to 331 thousand in 1990. The steepest fall came in the following decade, when the total declined by 63 thousand to 268 thousand. The downward trend continued into the twenty-first century, and by 2020 just 196 thousand marriages were recorded, fewer than half the number fifty years earlier.

Working arrangements, 2019

id wb1_mixed_12

The pie charts below show the ways in which a company's employees worked in 2019 and 2024, and the bar chart shows the company's office costs over the same period.

Band 6 177 words

Overview present but brief and placed at the end · all three visuals covered with accurate figures · adequate but mechanical linking · limited vocabulary · errors in prepositions, articles, agreement and a comma splice.

The pie charts show how the employees of a company worked in 2019 and 2024, and the bar chart shows how much the company spent for its offices from 2019 to 2024.

In 2019 most of employees worked in the office full-time, it was 82%. Only 12% worked hybrid and 6% were fully remote. However, in 2024 the situation was very different. Office full-time decreased to 24% and hybrid became the most popular with 58%. Fully remote also increased to 18%, which is three times more than 2019.

The bar chart shows that the total office costs was \$6.4 million in 2019. In 2020 it fell to \$5.7 million because energy and services went down from \$1.6 million to \$0.9 million, but the rent stayed at \$4.8 million until 2021. In 2022 the rent decreased to \$3.1 million and the total was \$4.4 million. In 2024 the total cost was only \$3.6 million, with rent \$2.6 million and energy \$1.0 million.

Overall, fewer employees worked in the office full-time and the company office costs decreased a lot.

Band 7

203 words

Clear overview linking working patterns and costs · key changes highlighted with accurate comparisons · logical progression and good linkers · some less common vocabulary (the norm, fluctuated) · one minor article slip.

The two pie charts compare the working arrangements of a company's employees in 2019 and 2024, while the bar chart illustrates the company's yearly office costs, broken down into rent and energy and services, over the same period.

Overall, there was a major shift away from full-time office work towards hybrid working. At the same time, the company's total office costs fell considerably, mainly as a result of lower rent.

In 2019, the vast majority of staff (82%) worked in the office full-time, while only 12% had hybrid arrangements and 6% worked fully remotely. Five years later, the picture had changed dramatically: hybrid working had become the norm for 58% of employees, and the proportion working fully remotely had tripled to 18%. Only 24% were still based in office full-time.

Regarding costs, the company spent \$6.4 million on its offices in 2019. Rent remained at \$4.8 million for three years before dropping to \$3.1 million in 2022 and \$2.6 million in 2024.

Spending on energy and services fluctuated, falling from \$1.6 million to \$0.9 million in 2020 and then recovering slightly to \$1.3 million in 2022, before ending at \$1.0 million. As a result, total costs fell by \$2.8 million to \$3.6 million.

Band 8

207 words

Sharp overview covering all three visuals · data interpreted skilfully (source of the 2020 dip, percentage saving) · cohesion seamless · precise vocabulary (predominant, stemmed, eased back) · error-free, varied structures.

The pie charts show how a company's workforce was divided between office-based, hybrid and fully remote working in 2019 and 2024, and the bar chart details the company's annual office costs from 2019 to 2024.

Over the five years, hybrid working replaced full-time office attendance as the predominant arrangement, and the company's office costs fell substantially, with rent accounting for most of the saving.

In 2019, 82% of employees worked full-time in the office, compared with 12% on hybrid arrangements and just 6% working fully remotely. By 2024 this pattern had been largely reversed: hybrid working accounted for 58% of staff, full-time office workers for only 24%, and the remote share had tripled to 18%.

Total office costs stood at \$6.4 million in 2019. Rent was fixed at \$4.8 million for the first three years, so the initial dip to \$5.7 million in 2020 stemmed entirely from lower spending on energy and services, which fell from \$1.6 million to \$0.9 million. Rent was then cut to \$3.1 million in 2022 and to \$2.6 million in 2024, and energy and service costs, after a modest rebound to \$1.3 million, eased back to \$1.0 million. Consequently, total costs in 2024 were \$3.6 million, some 44% below the 2019 figure.

☐ Approved ☐ Needs changes ☐ Notes:

Employment by sector

id wb1_mixed_13

The bar chart shows the number of people employed in three sectors in a region in 1980 and 2020, and the line graph shows the region's unemployment rate during the same period.

Band 6 180 words

Overview simple and placed at the end · key figures accurate though listed · mechanical linking · repetitive verbs (went up, went down) · errors in verb form, articles and a comma splice.

The bar chart shows how many people worked in manufacturing, mining and services in a region in 1980 and 2020, and the line graph shows the unemployment rate in the region from 1980 to 2020.

In the bar chart, manufacturing had 310 thousand workers in 1980 but it fell to 120 thousand in 2020. Mining also decreased very much from 95 thousand to only 8 thousand workers. However, services was different, it increased from 240 thousand to 520 thousand workers, so it became the biggest sector.

In the line graph, the unemployment was 5.1% in 1980. Then it rose sharply to 13.8% in 1985, which was the highest. After that it went down gradually to 11.2% in 1990, 9.4% in 1995, 7.6% in 2000 and 6.1% in 2005. In 2010 it increased again to 8.9%, but then it fell to 6.4% in 2015 and 5.3% in 2020.

Overall, the number of people in manufacturing and mining went down but services went up a lot. The unemployment rate went up and down, but in 2020 it was nearly same as 1980.

Band 7 193 words

Clear overview of the sectoral shift and unemployment pattern · key features well selected · logical paragraphs with good cohesion · some less common vocabulary (soared, workforce) · one minor slip.

The bar chart compares the number of people working in three sectors in a region in 1980 and 2020, and the line graph shows how the region's unemployment rate changed over the same forty years.

Overall, employment shifted dramatically from manufacturing and mining to services.

Unemployment fluctuated considerably, peaking in the mid-1980s, but by 2020 it had returned

almost the same level as in 1980.

In 1980, manufacturing was the largest employer, with 310 thousand workers, followed by services with 240 thousand and mining with 95 thousand. By 2020, however, the number of manufacturing jobs had dropped to 120 thousand, and mining had almost disappeared, employing just 8 thousand people. In contrast, the services sector more than doubled its workforce to 520 thousand.

As for unemployment, the rate was 5.1% in 1980 but soared to 13.8% within five years. It then fell steadily over the next two decades, reaching 6.1% in 2005. There was a further rise to 8.9% in 2010, although this was much smaller than the earlier one, and the rate then decreased again to 6.4% in 2015 and 5.3% in 2020, which was only slightly higher than at the start.

Band 8

194 words

Insightful overview synthesising both visuals · key features selected with accurate comparisons (total employment unchanged) · skilful cohesion · precise vocabulary (structural, contraction, volatile) · wide range of error-free structures.

The bar chart compares employment in manufacturing, mining and services in a region in 1980 and 2020, while the line graph tracks the regional unemployment rate over the intervening four decades.

The region's economy underwent a profound structural change, with services replacing manufacturing and mining as the main source of jobs. Unemployment was volatile, surging in the early 1980s and rising again around 2010, yet by 2020 it had fallen back almost to its 1980 level.

Manufacturing was the leading employer in 1980, with 310 thousand workers, but by 2020 its workforce had shrunk by more than half to 120 thousand. The contraction in mining was even more severe, from 95 thousand jobs to just 8 thousand. Services moved in the opposite direction, more than doubling from 240 thousand to 520 thousand workers, so that total employment across the three sectors was almost unchanged.

The unemployment rate rose from 5.1% in 1980 to a peak of 13.8% in 1985, before declining steadily to 6.1% by 2005. A second, smaller increase took it to 8.9% in 2010, after which it eased again, standing at 5.3% in 2020, only marginally above the rate forty years earlier.

Books read per adult per year

id wb1_mixed_14

The table below shows the number of books read per year by adults in one country, and the pie charts show the formats in which they read them in 2014 and 2024.

Band 6

183 words

Relevant overview near the start · both visuals covered accurately but with repetitive phrasing · simple linking (However, So) · limited vocabulary (increased, read more) · errors in agreement, articles, quantifiers and a comma splice.

The table shows how many books adults in one country read every year in 2014 and 2024 by age groups, and the pie charts show the formats they used for reading in these two years.

Overall, the oldest group read the most books in both years, and printed books was the most popular format, although audiobooks and e-books became more popular.

In the table, people aged 65 and over read the most books. They read 16 books in 2014 and 17 in 2024. The 50-64 group read 13 books in 2014 but it decreased to 12 in 2024. The 30-49 group also read less, from 11 to 9 books. However, the youngest group, 18-29, read more books in 2024, it increased from 9 to 12.

In the pie charts, printed book was 81% in 2014 but it fell to 59% in 2024. E-book increased from 15% to 23% and audiobook increased a lot from 4% to 18%, which is more than four times. So in 2024 the printed books were still the biggest part but it was smaller than before.

Band 7

203 words

Clear overview of age differences and the shift to digital · key features highlighted with apt comparisons · good range of linking devices · some less common vocabulary · one minor slip (less for fewer).

The table compares the average number of books read each year by adults in four age groups in 2014 and 2024, while the pie charts show the formats in which these books were read in the same two years.

Overall, the oldest age group read the most books in both years, and printed books remained the most popular format. However, there was a clear move towards digital formats, especially audiobooks, over the decade.

People aged 65 and over read 16 books per year in 2014, and this rose slightly to 17 in 2024. The youngest adults, aged 18 to 29, showed the biggest increase, from 9 to 12 books, whereas those aged 30 to 49 read fewer books, dropping from 11 to 9. The 50–64 age group read one book less in 2024, with the figure falling from 13 to 12.

In terms of format, printed books accounted for 81% of reading in 2014, but this share decreased to 59% ten years later. E-books grew in popularity from 15% to 23%, while the most dramatic change was in audiobooks, whose share rose more than fourfold from 4% to 18%. As a result, digital formats made up over 40% of reading by 2024.

Band 8

208 words

Well-crafted overview of both visuals · key changes selected and compared precisely (overtaking, combined digital share) · cohesion managed skilfully · precise, natural vocabulary (avid, lost ground) · error-free, varied structures.

The table sets out the average number of books read annually by adults in four age groups in 2014 and 2024, and the pie charts show the formats in which people read in those two years.

Reading habits varied by age, with the over-65s the most avid readers throughout, while the youngest adults recorded the greatest gain. Although printed books remained dominant, they lost considerable ground to digital alternatives, particularly audiobooks.

Adults aged 65 and over read 16 books a year in 2014 and 17 in 2024. The most notable change occurred among 18- to 29-year-olds, whose annual total rose by a third, from 9 to 12 books, enabling them to overtake the 30–49 age group. The latter was the only group to see a significant decline, from 11 books to 9, while readers aged 50 to 64 dipped marginally from 13 to 12.

As for format, printed books accounted for 81% of reading in 2014 but only 59% a decade later. E-books increased their share from 15% to 23%, and audiobooks, which represented a mere 4% in 2014, expanded more than fourfold to 18%. Consequently, digital formats together made up over two fifths of all reading by 2024, compared with under a fifth ten years earlier.

Electric vehicles in use, 2016-2024

id wb1_mixed_15

The line graph shows the number of electric vehicles on the roads of one country from 2016 to 2024, and the bar chart shows the number of public charging points in four regions in 2016 and 2024.

Band 6 184 words

Basic overview present · all figures accurate but reported one after another · simple, repetitive linking and verbs · some awkward word choice (specially) · errors in agreement, quantifiers and articles.

The line graph shows the number of electric vehicles in one country from 2016 to 2024, and the bar chart shows the number of public charging points in four regions in 2016 and 2024.

Overall, the number of electric vehicles increased very fast, and the charging points also increased in all region, specially in the capital.

In 2016 there was only 45 thousand electric vehicles. In 2018 the number increased to 110 thousand and in 2020 it was 260 thousand. After that, the growth was faster and it reached 620 thousand in 2022. In 2024 the number was 1,150 thousand, which is more than 25 times higher than 2016.

The bar chart shows that the capital had the most charging points in both years. It had 1.8 thousand in 2016 and it increased to 19.5 thousand in 2024. The other regions had much less. The North increased from 0.4 thousand to 4.1 thousand, the Central from 0.6 thousand to 7.8 thousand and the South from 0.5 thousand to 6.2 thousand. So the North had the smallest number of charging points in both years.

Band 7 204 words

Clear overview of both visuals · key features highlighted with useful multiples · logical organisation and good cohesion · some less common vocabulary (exponentially, tenfold) · one minor article slip.

The line graph illustrates the growth in the number of electric vehicles in use in one country between 2016 and 2024, and the bar chart compares the number of public charging points in four regions at the start and end of this period.

Overall, the number of electric vehicles increased exponentially, and there was a substantial rise in charging points in every region, with the capital having by far the most in both years.

In 2016, there were just 45 thousand electric vehicles. This figure more than doubled to 110 thousand by 2018 and to 260 thousand by 2020. Growth then accelerated even further, with the number reaching 620 thousand in 2022 and 1,150 thousand in 2024, which is over 25 times the 2016 level.

Regarding charging points, the capital had 1.8 thousand in 2016, more than the other three regions combined, and this number rose more than tenfold to 19.5 thousand in 2024. The Central region saw the most rapid growth, from 0.6 thousand to 7.8 thousand, a thirteen-fold increase. The South and the North also experienced significant increases, from 0.5 thousand to 6.2 thousand and from 0.4 thousand to 4.1 thousand respectively, but North remained the region with the fewest points.

Band 8

200 words

Skilful overview · data selected and compared precisely (multiples, combined totals) · sophisticated cohesion between absolute and proportional change · precise vocabulary (provision, infrastructure, commanding lead) · wide range of error-free structures.

The line graph shows how many electric vehicles were in use in one country from 2016 to 2024, while the bar chart compares the provision of public charging points across four regions in 2016 and 2024.

Electric vehicle numbers grew at an accelerating rate throughout the period, and charging infrastructure expanded dramatically in all four regions, although the capital retained a commanding lead.

From a modest base of 45 thousand in 2016, the number of electric vehicles more than doubled in each two-year interval up to 2022, when it reached 620 thousand. It then climbed by a further 530 thousand to 1,150 thousand in 2024, roughly 25 times the initial figure.

The number of charging points increased at least tenfold in every region. The capital, which already had 1.8 thousand points in 2016, had 19.5 thousand by 2024, more than the other three regions combined (18.1 thousand). Proportionally, however, the fastest expansion took place in the Central region, where provision rose thirteenfold from 0.6 to 7.8 thousand. The South also grew rapidly, from 0.5 to 6.2 thousand, while the North, starting from the lowest base of 0.4 thousand, still had the fewest points in 2024, at 4.1 thousand.

Children's daily activities (ages 8-12)

id wb1_mixed_16

The bar chart shows the average amount of time children in one country spent on different activities each day in 2004 and 2024, and the pie chart shows the devices they used to go online in 2024.

Band 6

175 words

Brief overview covering both visuals · key changes identified with accurate figures · basic linking (However, In contrast, About) · some awkward phrasing · frequent article and agreement errors that do not obscure meaning.

The bar chart shows how many minutes children aged 8 to 12 spent on five activities every day in 2004 and 2024, and the pie chart shows which devices they used for going online in 2024.

Overall, children spent much more time online in 2024 and less time on most other activities. Smartphone was the most common device.

In 2004, children watched TV for 125 minutes a day and played outdoor for 115 minutes, and these were the main activities. However, in 2024 these activities fell a lot, to 48 minutes for TV and 52 minutes for outdoor play. In contrast, the time for online and games increased dramatically from 20 minutes to 175 minutes, so it became the most popular activity. Reading also decreased from 35 to 22 minutes, and homework went down a little from 45 to 40 minutes.

About the devices, almost half of children used smartphone (46%) and 31% used tablet. Games consoles was 12% and laptop or PC was 9%. Only 2% of children uses smart TV to go online.

Band 7

202 words

Clear overview of the reversal in activities and main devices · key features highlighted with apt multiples · good cohesion · some less common vocabulary (dominated, took up) · one minor structural slip.

The bar chart compares the average time that children aged 8 to 12 in one country spent on five daily activities in 2004 and 2024, while the pie chart shows the main devices they used to access the internet in 2024.

Overall, time spent online or playing games rose dramatically, whereas all the other activities declined, particularly watching TV and playing outdoors. In 2024, smartphones and tablets were the devices children used most for going online.

In 2004, TV and outdoor play dominated children's days, at 125 and 115 minutes respectively, while only 20 minutes were spent online or on games. Twenty years later, this pattern had been reversed. Online activities and games took up 175 minutes per day, almost nine times as much as before, whereas TV viewing fell to 48 minutes and outdoor play to 52 minutes, both less than half their earlier levels. Reading time also dropped from 35 to 22 minutes, but homework changed very little, falling slightly from 45 to 40 minutes.

As for devices, smartphones were the most popular, used by 46% of children, followed by tablets at 31%. Games consoles and laptops or PCs accounted for 12% and 9% respectively, and smart TVs only 2%.

Band 8

210 words

Perceptive overview · data selected skilfully with an insightful derived comparison (162 minutes combined) · cohesion smooth throughout · precise vocabulary (pastimes, explosive growth, negligible) · wide range of error-free structures.

The bar chart compares how children aged 8 to 12 in one country divided their time between five daily activities in 2004 and 2024, and the pie chart identifies the main devices they used to go online in 2024.

The most striking change was the explosive growth in time spent online or gaming, which became by far the largest daily activity, while television viewing and outdoor play fell sharply. Handheld devices, particularly smartphones, were the main means of internet access.

In 2004, television and outdoor play were children's principal pastimes, occupying 125 and 115 minutes a day respectively, whereas online activities and games accounted for a mere 20 minutes. By 2024, the latter had soared to 175 minutes, almost three hours, which exceeded the combined time spent on all four other activities (162 minutes). Television and outdoor play had both more than halved, to 48 and 52 minutes, and reading had fallen from 35 to 22 minutes. Homework was the most stable activity, decreasing only marginally from 45 to 40 minutes.

Smartphones were the leading device for going online, used by 46% of children, with tablets second at 31%. Games consoles (12%) and laptops or PCs (9%) were far less common, and smart TVs were negligible at just 2%.

Water consumption in Aldburgh

id wb1_mixed_17

The table below shows water consumption in a city in 2004 and 2024, and the bar chart shows the reservoir level at the end of each season in 2024.

Use	2004 (million litres/day)	2024 (million litres/day)
Homes	142	128
Industry	96	54
Commerce & offices	38	45
Leakage	61	33
Total	337	260

Band 6

183 words

Short, basic overview · both visuals covered accurately, though with limited comparison · simple linking (However, So, Then) · repetitive vocabulary · errors in agreement, verb forms and relative pronouns.

The table shows how much water was used in Aldburgh city in 2004 and 2024, and the bar chart shows the level of the reservoir at the end of each seasons in 2024.

Overall, the total water consumption decreased and the reservoir was lowest in the summer.

In the table, homes used the most water in both years. It was 142 million litres per day in 2004 and 128 million litres in 2024. Industry used 96 million litres in 2004 but it dropped to 54 million litres, which is a big decrease. Leakage also fell from 61 to 33 million litres. However, commerce and offices was the only one that increased, from 38 to 45 million litres per day. So the total went down from 337 million to 260 million litres per day.

In the bar chart, the reservoir was 94% full at the end of winter, that was the highest level. Then it fell to 82% in spring and to 51% in summer. After summer it rised again to 67% in autumn, but it was still lower than in winter and spring.

Band 7

201 words

Clear overview of consumption and seasonal pattern · key features highlighted, including the largest fall · logical paragraphs and good linkers · some less common vocabulary (capacity, substantially) · one minor verb slip.

The table compares the amount of water used for different purposes in Aldburgh in 2004 and 2024, while the bar chart shows how full the city's reservoir was at the end of each season in 2024.

Overall, total water consumption fell considerably over the twenty years, with most categories declining. The reservoir level was highest after winter and lowest after summer.

In 2004, Aldburgh consumed 337 million litres of water a day, but by 2024 this had dropped to 260 million. Homes remained the largest user, although their consumption decrease slightly from 142 to 128 million litres. The most significant fall was seen in industry, whose use fell by 42 million litres, from 96 to 54 million, and leakage was also reduced substantially, from 61 to 33 million litres. Commerce and offices was the only category to increase, rising from 38 to 45 million litres per day.

Turning to the reservoir, it was 94% full at the end of winter 2024. The level then declined to 82% by the end of spring and fell sharply to just 51% after summer, meaning that it was only around half full. By the end of autumn, it had partly recovered to 67% of capacity.

Band 8

191 words

Well-structured overview that identifies what drove the fall in total use · figures selected and combined accurately · cohesion managed skilfully · precise vocabulary (depleted, bucked the trend, eased) · error-free, varied structures.

The table details daily water consumption in Aldburgh by type of use in 2004 and 2024, and the bar chart shows the city's reservoir level at the end of each season in 2024.

The city's total water use fell markedly over the twenty years, mainly because of reductions in industrial demand and leakage. In 2024, the reservoir followed a clear seasonal cycle, being fullest after winter and most depleted after summer.

Total consumption dropped from 337 to 260 million litres per day, a reduction of 77 million litres. Industry and leakage together accounted for most of this decrease: industrial use fell from 96 to 54 million litres, and losses through leakage were cut from 61 to 33 million. Homes continued to be the largest consumer, although their use eased from 142 to 128 million litres. Commerce and offices bucked the overall trend, with consumption rising from 38 to 45 million litres.

The reservoir stood at 94% of capacity at the end of winter, slipping to 82% by the end of spring. It then dropped steeply over the summer, to just 51%, before partially recovering to 67% by the end of autumn.

Average new home price, 2000-2024

id wb1_mixed_18

The line graph shows the average price of a new home in one country between 2000 and 2024, and the bar chart compares average house prices with average annual earnings in the same years.

Band 6 184 words

Overview present but loosely expressed · both visuals covered accurately with every figure listed · adequate but mechanical linking · limited vocabulary · errors in verb form, comparatives and word choice.

The line graph shows the average price of a new home in one country from 2000 to 2024, and the bar chart shows the house prices compared to average earnings in the same years.

Overall, house prices went up in most years and houses became less affordable because the ratio also increased.

In 2000 a new home cost \$96 thousand on average. The price increased quickly to \$148 thousand in 2004 and \$186 thousand in 2008. However, in 2012 there was a small fall to \$172 thousand. After that the price rose again in every period and it reached \$215 thousand in 2016, \$251 thousand in 2020 and \$298 thousand in 2024. It means the price was more than three times higher than in 2000.

The bar chart has a similar pattern. In 2000 the house price was 4.1 times the average annual earnings, and it went up to 5.6 in 2004 and 6.3 in 2008. Then it dropped to 5.7 in 2012, but after that it increased to 6.6, 7.2 and finally 8.1 in 2024. This is almost double of the 2000 ratio.

Band 7 198 words

Clear overview linking the two measures · key features highlighted with accurate comparisons · good progression and cohesion · some less common vocabulary (relative to, dip) · two minor grammatical slips.

The line graph illustrates how the average price of a new home in one country changed between 2000 and 2024, while the bar chart compares average house prices with average yearly earnings over the same period.

Overall, new home prices rose substantially, apart from a slight dip in 2012, and houses became increasingly expensive relative to earnings, following a very similar pattern.

In 2000, a new home cost US\$96 thousand on average. Prices climbed rapidly to US\$186 thousand in 2008, nearly double the initial figure, before falling back slightly to US\$172 thousand in 2012. From then on, they increased steadily, reaching US\$215 thousand in 2016 and US\$251 thousand in 2020, and peaking at US\$298 thousand in 2024, more than three times the 2000 level.

The ratio of house prices to earnings shows the same trend. At the start of the period, an average house cost 4.1 times the average annual salary, and this figure rose to 6.3 in 2008. It then fell to 5.7 in 2012, but it has risen continuously since then, reaching 7.2 in 2020 and 8.1 in 2024. This means that, compared to earnings, housing was almost twice as expensive in 2024 than in 2000.

Band 8

201 words

Concise overview drawing a valid conclusion from both visuals · figures selected and compared precisely · sophisticated cohesion (In other words, Thereafter) · precise vocabulary · wide range of structures, error-free.

The line graph tracks the average price of a new home in one country from 2000 to 2024, and the bar chart expresses average house prices as a multiple of average annual earnings over the same years.

Both measures rose markedly across the period, interrupted only by a modest dip in 2012, indicating that housing became considerably less affordable.

The average new home cost US\$96 thousand in 2000, but prices increased sharply over the next eight years to US\$186 thousand. After easing to US\$172 thousand in 2012, they resumed their upward path, climbing to US\$251 thousand by 2020 and US\$298 thousand by 2024, more than three times their 2000 level.

The price-to-earnings ratio mirrored this pattern closely. In 2000, a home cost 4.1 times the average annual wage, a figure that had climbed to 6.3 by 2008 before slipping to 5.7 in 2012. Thereafter, the ratio rose without interruption, to 6.6 in 2016, 7.2 in 2020 and 8.1 in 2024. In other words, relative to earnings, housing was almost twice as expensive at the end of the period as it had been at the start, although this near doubling was far smaller than the more than threefold rise in prices themselves.

Causes of global forest loss, 2001-2020

id wb1_mixed_19

The pie chart below shows the causes of global forest loss between 2001 and 2020, and the bar chart shows the area of forest lost in four regions in the same period.

Causes of global forest loss, 2001-2020

Forest area lost by region, 2001-2020

Band 6

179 words

Overview present but general · key figures accurate and both visuals covered · simple linking and some informal phrasing (it is still a big number) · errors in agreement, articles and word form.

The pie chart shows the reasons for forest loss in the world between 2001 and 2020, and the bar chart shows how much forest was lost in four regions in the same period.

Overall, the main causes was agriculture, logging and wildfire, and South America lost the most forest.

In the pie chart, commodity agriculture was the biggest cause with 27%. Forestry, which means logging, was nearly the same with 26%. Wildfire and shifting agriculture had the same percentage, 23% each. Urban expansion was very small cause, only 1%. If we add the two kinds of agriculture together, it is half of the forest loss.

In the bar chart, South America lost 89 million hectares of forest, which was the highest. Africa was the second with 76 million hectares and Asia lost 72 million hectares, so they was quite similar. North America lost the least forest, 58 million hectares, but it is still a big number.

To conclude, forests were lost for many reasons and in all of the four regions, but the most loss was in South America.

Band 7

183 words

Clear overview of causes and regions · key features highlighted, with sensible grouping of agricultural causes · good cohesion · some less common vocabulary (minimal, responsible for) · one minor agreement slip.

The pie chart illustrates the main causes of forest loss worldwide from 2001 to 2020, and the bar chart compares the area of forest lost in four regions over the same two decades.

Overall, forest loss was caused mainly by four factors of roughly equal importance, while urban expansion played only a minimal role. Among the regions, South America lost the largest area of forest and North America the smallest.

According to the pie chart, commodity agriculture was responsible for the largest share of forest loss, at 27%, closely followed by forestry, or logging, at 26%. Wildfires and shifting agriculture each accounted for 23%, which mean that agriculture of both types together caused half of all forest loss. By contrast, urban expansion was responsible for just 1%.

Turning to the regional data, South America lost 89 million hectares of forest during this period, the highest figure among the four regions. Africa and Asia experienced similar losses, of 76 and 72 million hectares respectively. North America lost the least, 58 million hectares, although this was still around two thirds of the South American figure.

Band 8

189 words

Well-judged overview · data grouped insightfully (combined agriculture, regional total) with accurate derived figures · seamless cohesion · precise vocabulary (drivers, negligible, comparable) · varied, error-free structures.

The pie chart breaks down the causes of global forest loss between 2001 and 2020, while the bar chart compares the area of forest lost in four regions over the same period.

Forest loss resulted from four main drivers of broadly similar significance, with urban expansion a negligible factor. Regionally, South America suffered the greatest losses, although all four regions lost substantial areas of forest.

Commodity agriculture was the single largest cause, accounting for 27% of forest loss, marginally ahead of forestry and logging at 26%. Wildfire and shifting agriculture were each responsible for 23%, so that the two forms of agriculture combined were behind exactly half of all losses. Urban expansion, by comparison, contributed a mere 1%.

South America lost 89 million hectares of forest, the largest area of the four regions. Africa and Asia recorded comparable losses of 76 and 72 million hectares respectively, while North America lost the least, at 58 million hectares. Even so, the gap between the highest and lowest figures was relatively modest, at 31 million hectares, and together the four regions lost almost 300 million hectares of forest over the two decades.

Annual museum visitors, 2016-2024

id wb1_mixed_20

The line graph shows the number of visitors to a museum each year between 2016 and 2024, and the table shows the museum's sources of income in 2016 and 2024.

Museum income by source (US\$ million)

Source	2016	2024
Government grant	6.2	4.1
Ticket sales	2.4	4.6
Shop & café	1.3	2.5
Donations	0.8	1.1
Total	10.7	12.3

Band 6

190 words

Brief overview placed at the end · all figures accurate, both visuals covered · repetitive linking and verbs (increased, went up) · errors in verb forms, pronoun agreement, articles and a comma splice.

The line graph shows how many people visited a museum every year from 2016 to 2024, and the table shows where the museum got its money from in 2016 and 2024.

In 2016 the museum had 610 thousand visitors and the number increased every year until 2019, when it was 720 thousand. However, in 2020 the visitors fell sharply to only 150 thousand. After that the number went up again, it was 280 thousand in 2021, 530 thousand in 2022 and 680 thousand in 2023. In 2024 there were 760 thousand visitors, the highest number.

Looking at the table, the government grant was the biggest source of income in 2016 with \$6.2 million, but it decreased to \$4.1 million in 2024. On the other hand, ticket sales increased from \$2.4 million to \$4.6 million and it became the biggest source. The shop and café income also increased from \$1.3 million to \$2.5 million and donations went up from \$0.8 million to \$1.1 million. The total rose from \$10.7 million to \$12.3 million.

Overall, the visitors recovered after 2020 and the museum got less money from government but more from tickets.

Band 7

197 words

Clear overview linking visitors and income · key features highlighted with accurate comparisons (a fifth, almost doubled) · good cohesion · some less common vocabulary (collapsed, exceeded) · one minor agreement slip.

The line graph shows the number of people who visited a museum annually between 2016 and 2024, and the table compares the museum's income from four sources in 2016 and 2024.

Overall, visitor numbers grew steadily except for a dramatic fall in 2020, after which they recovered to a new high. Meanwhile, the museum's total income increased, with ticket sales replacing the government grant as its main source of money.

In 2016, 610 thousand people visited the museum, and this rose each year to 720 thousand in 2019. In 2020, however, visitor numbers collapsed to only 150 thousand, around a fifth of the previous year's figure. A strong recovery followed, with numbers climbing to 530 thousand in 2022 and to 760 thousand in 2024, which exceeded the pre-2020 peak.

Regarding income, the government grant fell from US\$6.2 million to US\$4.1 million, while income from ticket sales almost doubled, from US\$2.4 million to US\$4.6 million, making it the largest source by 2024. Earnings from the shop and café also nearly doubled to US\$2.5 million, and donations rises slightly from US\$0.8 million to US\$1.1 million. As a result, the museum's total income increased from US\$10.7 million to US\$12.3 million.

Band 8

209 words

Skilful overview connecting attendance and funding · figures selected purposefully with accurate proportions · cohesion managed smoothly · precise vocabulary (slump, earned revenue, edged up) · wide range of error-free structures.

The line graph charts annual visitor numbers at a museum from 2016 to 2024, while the table sets out the museum's income by source in the first and last of those years.

Apart from a severe slump in 2020, attendance rose throughout the period, ending at its highest level. Over the same timeframe, the museum's income grew and its funding shifted markedly away from government support towards earned revenue, particularly ticket sales.

Visitor numbers increased steadily from 610 thousand in 2016 to 720 thousand in 2019, before plunging to just 150 thousand in 2020, only around a fifth of the previous year's total. The recovery was rapid: attendance almost doubled to 280 thousand in 2021, reached 680 thousand in 2023, and hit a high of 760 thousand in 2024.

In 2016, the government grant of US\$6.2 million made up well over half of the museum's US\$10.7 million income. By 2024, however, the grant had been cut to US\$4.1 million and was overtaken by ticket sales, which nearly doubled from US\$2.4 million to US\$4.6 million. Revenue from the shop and café rose by a similar proportion, from US\$1.3 million to US\$2.5 million, and donations edged up from US\$0.8 million to US\$1.1 million. As a result, total income reached US\$12.3 million.
